Subject: Semi-Annual Groundwater Monitoring Report, Third and Fourth Quarters 2006,
 Presidio-Wide Quarterly Groundwater Monitoring Program, Presidio of San Francisco,
 California

Dear Devender and Robert:

Attached please find one hard copy and one electronic copy of the *Semi-Annual Groundwater Monitoring Report, Third and Fourth Quarters 2006, Presidio-Wide Quarterly Groundwater Monitoring Program, Presidio of San Francisco (Volumes I and II)* prepared by Treadwell & Rollo for the Presidio Trust. This document is being submitted in accordance with Task 11 of the RWQCB Order R2-2003-0080.

Please feel free to call me at 415-561-4259 if you have any questions and/or comments.

Sincerely,
The Presidio Trust

Craig Cooper
Remediation Program Manager

Enclosure

cc: Brian Ullensvang, NPS
 Doug Kern, RAB (electronic only)

TABLE OF CONTENTS

LIST OF ACRONYMS AND ABBREVIATIONS	xvi
EXECUTIVE SUMMARY	ES-1
1.0 INTRODUCTION	1
1.1 Report Organization	2
1.2 Field Sampling Plan	3
1.3 Groundwater Monitoring Objectives	3
2.0 BACKGROUND	5
3.0 GEOLOGIC AND HYDROGEOLOGIC SETTING	6
4.0 GROUNDWATER MONITORING	8
4.1 Groundwater Elevation Monitoring	8
4.1.1 Groundwater Elevation Monitoring at Tidally Influenced Wells	9
4.2 Groundwater Sampling	10
4.2.1 Groundwater Purging Methods and Selection Criteria	11
4.2.1.1 Groundwater Purging Methods	11
4.2.1.2 Groundwater Purging Method Selection Criteria	12
4.2.2 Groundwater Sampling Methods	12
4.2.2.1 Groundwater Sampling Methods After Normal Purging	12
4.2.2.2 Groundwater Sampling After Low-Flow Purging	12
4.2.2.3 Sampling at Seeps	13
4.3 Sample Preservation, Handling, and Transportation	13
4.3.1 Sample Labels and Chain-of-Custody Documentation	13
4.3.2 Filtration of Groundwater Samples for Metals Analyses	14
5.0 LABORATORY ANALYSES	16
5.1 Analytical Methods	16
5.2 Analytical Data Delivery Methods	17
5.3 Analytical Results	17
5.4 Analytical Data Comparability	18
5.4.1 Field Methods	18
5.4.1.1 Dissolved Oxygen	18
5.4.2 Analytical Suite	19

TABLE OF CONTENTS (Continued)

5.4.3	Analytical Methods	19
5.4.3.1	TPH Analyses	19
5.4.3.2	Xylene Analyses	20
5.4.3.3	PAH Analyses	20
5.4.3.4	Metals Analyses	20
6.0	QUALITY ASSURANCE, QUALITY CONTROL, AND DATA VALIDATION	22
6.1	Data Validation	22
6.2	Quality Assurance and Quality Control Sampling	23
6.2.1	Duplicate Samples	23
6.2.1.1	Duplicate Sample Analytical Results	24
6.2.1.2	Quality Control Duplicate Sample Analytical Results	25
6.2.2	Equipment Rinsate Blanks	26
6.2.3	Trip Blanks	27

**SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California**

E.1 EXECUTIVE SUMMARY

The Presidio-Wide Quarterly Groundwater Monitoring Program continued, with modifications, during the Third and Fourth Quarters 2006. The Third Quarter 2006 sampling event began on 16 August and was completed on 18 August 2006. The Fourth Quarter 2006 sampling event began on 4 December 2006 and was completed on 6 December 2006. This executive summary serves as a semi-annual summary of the groundwater monitoring program at the Presidio for the second half of 2006.

E.1.1 Changes to the Quarterly Groundwater Monitoring Program, Third and Fourth Quarters 2006

Several modifications to the Presidio-wide Quarterly Monitoring Program were implemented during the Third and Fourth Quarters 2006. Changes to the monitoring program are depicted in red text in Tables 1A and 1B. The majority of the changes were associated with reductions in sampling frequency at sites with decision documents in place. All changes approved for the Third and Fourth Quarters 2006 are summarized below and are detailed in Tables 1A and 1B, respectively.

E.1.1.1 Third Quarter 2006

The following changes were approved and implemented during the Third Quarter 2006, as detailed in Table 1A.

Sampling Method Modifications

No monitoring well, piezometer, or seep sampling method modifications were proposed during the Third Quarter 2006.

Water Level/Seep Evaluation Frequency Changes

No changes were proposed for the frequency of water level/seep evaluation measurements during the Third Quarter 2006, as detailed in Table 1A.

Analytical Additions and Reductions

Several changes in the sampling and analytical program scope were approved for the Third Quarter 2006. The following changes were approved and implemented during the Third Quarter 2006, as detailed in Table 1A.

- Sampling at 1349MW02 has been reduced to annual until the Building 1349 Area CAP has been implemented. This change is in accordance with the Fill Site 5 RAP and is consistent with other like Building 1349 Area wells.
- Landfill 10 monitoring well LF10GW02 and seep LF10SP01 could not be sampled during the First or Second Quarters 2006 due to thick vegetation overgrowth. Samples were proposed for collection at these locations during the Third Quarter 2006.

E.1.1.2 Fourth Quarter 2006

The following changes were approved and implemented during the Fourth Quarter 2006, as detailed in Table 1B.

Sampling Method Modifications

No monitoring well, piezometer, or seep sampling method modifications were proposed during the Fourth Quarter 2006.

Water Level/Seep Evaluation Frequency Changes

The frequency of water level / seep evaluation measurements was reduced to annual to match the sampling frequency for all Landfill 8, Building 900s Area, Fill Site 1, Landfill 2, El Polin Spring, and Landfill E (with the exception of DAESP03) monitoring locations.

Based on the large historical data set, the frequency of water level measurements has been reduced to annual for all Upgradient and Tennessee Hollow monitoring wells.

The frequency of water level / seep evaluation measurements was reduced to semi-annual to match the sampling frequency for all Fill Site 5 and Nike Missile Facility monitoring locations.

Water level / seep evaluation measurements have been temporarily suspended at the Commissary/PX Area while the CAP is being implemented. Water level/seep evaluation measurements will resume at the Commissary/PX Area, in accordance with the CAP, following its implementation.

All changes proposed for the frequency of water level/seep evaluation measurements during the Fourth Quarter 2006 are detailed in Table 1B.

Analytical Additions and Reductions

There were some additions and reductions in the sampling and analytical program scope approved prior to the Fourth Quarter 2006, as detailed below.

- Sampling at the Commissary/PX Area was temporarily suspended prior to the Fourth Quarter 2006, while the Commissary/PX Area CAP is being implemented. Sampling will resume, in accordance with the CAP, when the implementation is complete.
- In accordance with the RAP, TPH analyses were reduced to semi-annual sampling at Baker Beach Disturbed Area 3 monitoring well BB3GW100, as no TPH detections have occurred for four quarterly events.
- Landfill 10 locations LF10GW02 and LF10SP01 could not be sampled during the First, Second, or Third Quarters 2006 due to thick vegetation overgrowth. The brush was cleared prior to the Fourth Quarter 2006 and samples were collected at these locations, as proposed, during the Fourth Quarter 2006.

E.1.2 Arsenic and Redox Evaluations

Several parameters were measured in the field and in the laboratory to help determine the redox state of groundwater at Fill Site 6, Building 231/207, Building 1065, and Commissary/PX Areas. The parameters collected were included in the groundwater monitoring program at the aforementioned sites during the Third and/or Fourth Quarter 2006.

The field and analytical data were collected at Fill Site 6, Building 231/207, Building 1065 and Commissary/PX Areas to better understand redox conditions at each site. Modified redox diagrams were developed for Fill Site 6 (A-3), Building 231/207 (A-10), Building 1065 (A-11) and Commissary/PX (A-16) Areas and presented to illustrate the redox conditions spatially across each site.

The redox diagrams were generated using the Sequence™ program and imported onto the figures. The redox diagrams were developed using concentrations of dissolved oxygen, nitrate, manganese, iron, sulfate and methane. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring well location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon, the more oxidizing the environment is within the well location; conversely, the smaller the polygon, the more reducing the environment. Examples of typical redox environments (i.e., aerobic, nitrate-reducing, manganogenic, ferrogenic, sulfate-reducing, and methanogenic) and their associated redox diagrams are presented on each redox diagram figure.

E.1.3 Significant Observations and Accomplishments in Third and Fourth Quarters 2006

Significant changes or trends in groundwater characteristics and chemistry as well as significant site-specific milestones are discussed below. Changes to proposed site-specific sampling schedules are discussed in the site-specific sections of Appendix A.

E.1.3.1 Building 900s Area (Appendix A-1)

Groundwater elevations, gradients, and flow directions during Third Quarter 2006 are consistent with historical values and interpretations. The groundwater sampling frequency at the Building 900s Area will continue to be annual until the first five-year review, which is scheduled to be completed in 2007.

E.1.3.2 Landfill 8 (Appendix A-2)

Groundwater elevations, gradients, and flow directions during the Third Quarter 2006 are consistent with historical values and interpretations.

Until the Landfill 8 RAP has been finalized and implemented, the sampling frequency and groundwater elevation measurements at Landfill 8 will continue to be annual during the First Quarter only. Sampling at Landfill 8 will be performed per the Landfill 8 RAP following the RAP implementation.

E.1.3.3 Fill Site 6 (Appendix A-3)

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at Fill Site 6 during the Third and Fourth Quarters 2006.

No applicable groundwater cleanup levels were exceeded at Fill Site 6 during either the Third or Fourth Quarters 2006.

E.1.3.4 Battery Howe/Wagner (Appendix A-4)

Groundwater elevations, gradients, and flow directions during Third and Fourth Quarters 2006 are consistent with historical values and interpretations.

Dissolved oxygen and general chemistry results during the Third and Fourth Quarters 2006 were generally within historical ranges.

Third and Fourth Quarters 2006 were only the second and third times, respectively, that dissolved metals have been analyzed for in samples from wells HWGW100 and HWGW101. Therefore, analysis for dissolved metals will continue at these and remaining locations in future

monitoring events to establish a baseline for HWGW100 and HWGW101 and to determine if metals concentrations are increasing or decreasing.

E.1.3.5 Building 1349 Area (Appendix A-5)

Four Building 1349 monitoring wells were sampled during the Third Quarter 2006. Only well 1349MW100 was sampled during the Fourth Quarter 2006.

The Building 1349 Study Area Final CAP was submitted to the stakeholders in February 2006, and was approved by the RWQCB in February 2006. Groundwater sampling at the Building 1349 Area will be conducted in accordance with the Final CAP when the CAP is implemented. The recommended corrective actions for the Building 1349 Area are discussed in Section 4.0 of this appendix. Cleanup levels in the Final CAP are presented in Tables A-5-2 through A-5-7.

TPH, OCP, PAH and VOC concentrations continue to be detected in monitoring well 1349MW100 groundwater samples above CAP-specified cleanup levels. The majority of the dissolved metal concentrations detected during the Third and Fourth Quarters 2006 are within historical ranges. Arsenic was detected above the CAP-specified cleanup level of 10 µg/L during the Fourth Quarter 2006 at a concentration 12 µg/L in well 1349MW100. Arsenic concentrations continue to fluctuate within this well around the CAP-specified cleanup level.

Groundwater concentration trends, within both monitoring well 1349MW100 and the remaining wells associated with Building 1349 Study Area, will continue to be monitored and evaluated.

E.1.3.6 Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, And Upgradient Wells (Appendix A-6)

Groundwater elevations and flow directions measured during the Third Quarter 2006 were consistent with historical measurements. Groundwater sampling will continue at Fill Site 1, Landfill 2, and El Polin Spring during First Quarter 2007.

E.1.3.7 Landfill E (Appendix A-7)

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at Landfill E during the Third Quarter 2006.

The proposed sampling frequency at Landfill E seep (DAESP03) was increased to quarterly beginning with the First Quarter 2006 to assess seasonal and variable conditions. All other site wells are sampled on an annual basis in the First Quarter of each year. Due to the non-flowing conditions in Landfill E seep DAESP03, no groundwater samples were collected; thus there were no analytical results for the Third and Fourth Quarters 2006.

A FS has been prepared for Landfill E (CH2MHill, 2005). The reduction to annual sampling at monitoring wells DAEGW03 through DAEGW08 until a Landfill E RAP have been finalized was approved by the stakeholders prior to First Quarter 2004. Sampling will be performed per the RAP once it has been finalized and implemented.

E.1.3.8 Landfill 4 (Appendix A-8)

No significant trends were observed in the samples collected during the Third and Fourth Quarters 2006. The majority of the general chemistry parameter results measured during the Third and Fourth Quarters 2006 are within historical ranges and appear to be stable. No PCBs were detected above the laboratory's reporting limit within LF4GW103 or LF4GW104 during the Third Quarter 2006.

Dissolved metals concentrations at Landfill 4 have remained relatively stable in recent quarters. No dissolved metals exceeded the RAP-specified cleanup levels during the Third or Fourth Quarters 2006. However, dissolved nickel was detected at the cleanup level of 100 µg/L within LF4GW103 during both the Third and Fourth Quarters 2006. Nickel has been detected at concentrations above its applicable cleanup level several times within LF4GW103 during recent monitoring events. Therefore, the potential for increasing or decreasing dissolved nickel concentrations within monitoring wells LF4GW103 and LF4GW104 will continue to be evaluated in future monitoring events, in accordance with the RAP.

E.1.3.9 Fill Site 5 (Appendix A-9)

Groundwater elevations at Fill Site 5 were generally higher during the Third Quarter 2006 when compared to the Third Quarter 2005 at Fill Site 5. Elevations, gradients and flow directions are consistent with historical values and interpretations. Groundwater monitoring well locations and groundwater elevations are illustrated on Figure A-9-1.

Samples collected from Fill Site 5 monitoring wells during the Third Quarter 2006 were analyzed for OCPs. No OCPs were detected within the Fill Site 5 monitoring wells sampled during the Third Quarter 2006.

Dissolved oxygen concentrations measured were within historical ranges.

TPHg, TPHd, several VOCs, OCPs, PAHs, and dissolved metals were detected in the upgradient Building 1349 monitoring well 1349MW100 samples during the Third and Fourth Quarters 2006. Fill Site 5 RAP cleanup levels do not apply to upgradient Building 1349 monitoring wells.

E.1.3.10 Building 231/207 Area (Appendix A-10)

Building 231/207 Area monitoring well 231MW09 was purged and sampled during the Third and Fourth Quarters 2006 and was the only Building 231/207 monitoring well scheduled for

sampling during these events. No TPH or VOC compounds were detected at or above their laboratory reporting limits.

The majority of detected analytes were within historical bounds during the Third and Fourth Quarters 2006. Dissolved nickel was detected at 231GW09 above its CAP-specified cleanup level during both the Third and Fourth Quarters 2006. However, both of these detections were within historical ranges. No other CAP-specified cleanup levels were exceeded during either the Third or Fourth Quarters 2006. There are no proposed changes to the groundwater sampling schedule or procedures at this site.

E.1.3.11 Building 1065/1027 Area (Appendix A-11)

TPHd was detected within piezometer 1065PZ4A in the Third Quarter 2006 at 90 µg/L, for the first time since the Third Quarter 2001; however, no TPHg, TPHd and TPHfo concentrations detected were in excess of CAP-specified cleanup levels.

Dissolved arsenic continues to be detected at concentrations exceeding the CAP-specified cleanup level (10 µg/L) within 1065PZ1A, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A, and 1065MW101. The dissolved arsenic concentrations detected within 1065MW9A and 1065MW101 were detected at new high concentrations.

Several new high concentrations of MTBE were detected during the Third and Fourth Quarters 2006 within the Building 1065 Area, but the concentrations are all under the CAP-specified cleanup level of 13 µg/L for MTBE at the Building 1065 Area.

Groundwater sampling frequency was reduced to annual within all Building 1065/1027 Area wells and piezometers, except 1065PZ1A, 1065PZ1B, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A, 1065MW9B, 1065MW101, 1065MW102, and 1047MW101 until the Building 1065/1027 Area CAP is approved and implemented, at which time the groundwater monitoring program will be conducted in accordance with the CAP.

E.1.3.12 Mini-CAP Areas (Appendix A-12)

TPHg continues to be detected in monitoring well 1213GW101 at concentrations below its cleanup level. Benzene and 1,2-dichloroethane were detected in monitoring well 1213GW101 at concentrations above their groundwater cleanup levels during both the Third and Fourth Quarters 2006. Chromium was detected above its cleanup level within 1213GW101 during the Fourth Quarter 2006; though the elevated chromium concentration is thought to be from naturally occurring chromium found in the serpentinite rock in which this well is screened. No other compounds were detected in Mini-CAP groundwater samples above their associated cleanup levels during the Third and Fourth Quarters 2006.

E.1.3.13 Nike Missile Facility (Appendix A-13)

Groundwater elevations, gradients, and flow directions during the Third Quarter 2006 are consistent with historical values and interpretations.

NDMA was not detected within any of the Third Quarter 2006 groundwater samples. This is the first sampling event where NDMA was not detected above laboratory detection limits in groundwater samples from NKGW01, NKGW04, and NKGW05. NDMA was detected above laboratory limits within three of the four Nike Missile Facility monitoring wells during the First Quarter 2006.

A RAP is currently being prepared for the Nike Missile Facility and a revised groundwater monitoring plan will be implemented, in accordance with the RAP, when it is approved by the DTSC, RWQCB, and other stakeholders. There are no proposed changes to the groundwater monitoring program at this site.

E.1.3.14 Baker Beach Disturbed Area 3 (Appendix A-14)

The Third and Fourth Quarters 2006 were the eighth and ninth monitoring events, respectively, conducted at BBDA 3 since the groundwater monitoring network was installed. No RAP-specified cleanup level exceedances have been detected to date within any groundwater or surface water samples collected following the remedial action.

No significant trends were identified during the Third and Fourth Quarters 2006 at BBDA 3. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP.

E.1.3.15 Landfill 10 (Appendix A-15)

Groundwater elevations, gradients, and flow directions during Third and Fourth Quarters 2006 are consistent with historical values and interpretations.

During the Fourth Quarter 2006, TPHd and TPHfo were detected in seep LF10SP01 at new high concentrations of 2,700 µg/L and 1,100 µg/L, respectively. The concentration of TPHd was almost 20 times higher than the previously recorded high concentration and was the first detection of TPHd at this location since the Second Quarter 2003. TPHfo was detected for the first time at this location. TPH will continue to be monitored within Landfill 10 monitoring wells and seep LF10SP01 during future sampling events to see if apparent trends develop or if the Fourth Quarter 2006 results at LF10SP01 are an anomaly.

MTBE was detected at a new high concentration of 18 µg/L within monitoring well LF10GW02 during the Fourth Quarter 2006. MTBE will continue to be measured at LF10GW02.

Total vanadium was detected for the first time during Fourth Quarter 2006 at a concentration of 13 µg/L. Dissolved metal and total metal concentrations will continue to be measured at LF10SP01 to see if apparent trends develop.

E.1.3.16 Commissary/PX Area (Appendix A-16)

No CAP-specified cleanup levels were exceeded during the Third Quarter 2006. No other significant findings or data trends were observed during the Third Quarter 2006.

Groundwater monitoring will not be performed within Commissary/PX Area monitoring wells until the CAP is finalized and implemented at which point groundwater monitoring will be conducted in accordance with the Revised Final CAP.

E.1.3.17 Baker Beach Disturbed Areas 1 and 2A (Appendix A-17)

BBDAs 1 and 2A were added to the Presidio-Wide Groundwater Monitoring Program beginning Second Quarter 2006. Two piezometers (BB1PZ100 and BB1PZ101) monitor fresh water seeps at BBDA 1 and one seep location is monitored at BBDA 2A (BB2ASW100).

Due to limited data collected to date, no significant trends were identified during the Third and Fourth Quarters 2006 at BBDAs 1 and 2A. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP, which is scheduled to be completed in 2007.

No RAP-specified cleanup levels were exceeded in BB1PZ100 or BB1PZ101 during the Third or Fourth Quarters 2006.

**SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
PRESIDIO-WIDE GROUNDWATER MONITORING PROGRAM
Presidio of San Francisco, California**

1.0 INTRODUCTION

This Semi-Annual Groundwater Monitoring Report for the Third and Fourth Quarters 2006 of the Presidio-Wide Groundwater Monitoring Program has been prepared by Treadwell & Rollo, Inc. (Treadwell & Rollo) for The Presidio Trust (Trust). During the Third and Fourth Quarters 2006, 17 sites at the Presidio of San Francisco (Presidio) were included in the groundwater monitoring program, as shown on Figure 1. Although the Presidio is currently under the jurisdiction of the Trust and the National Park Service (NPS), the Trust is managing the Presidio-wide Groundwater Monitoring Program.

This report describes the groundwater elevation monitoring and sampling methods used, summarizes the laboratory analytical procedures and results, and presents the results of the quality assurance and quality control (QA/QC) and data validation activities for samples collected during the Third and Fourth Quarters 2006. This report also summarizes historical sampling data previously collected by others. The groundwater monitoring, laboratory, and data validation methods and procedures used by others during historical sampling events have been discussed in previous quarterly groundwater monitoring reports (Montgomery Watson, 1996b, 1999a-n, 2000; Treadwell & Rollo, 2001b, 2002b, 2002d, 2002f, 2002g, 2002h).

The Trust worked with the United States Environmental Protection Agency (EPA), California Environmental Protection Agency, Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board, San Francisco Bay Region (RWQCB), and Restoration Advisory Board (RAB) representatives to develop the Cleanup Levels Document. The *Development of Presidio-Wide Cleanup Levels for Soil, Sediment, Groundwater, and Surface Water* (Cleanup Levels Document) summarizes the derivation of human health and ecological cleanup for soil, sediment, groundwater, and surface water, and the development of soil background metal concentrations at the Presidio (Erler & Kalinowski, Inc. [EKI], 2002). The document also presents the proposed methodology for determining Presidio-specific cleanup levels based on the protection of human health and ecological receptors for chemicals that may potentially be encountered in soil, sediment, and water at the Presidio (EKI, 2002). These cleanup levels were developed to be applied to new decision documents for chemical release sites within the Presidio.

Cleanup of petroleum program sites, such as the Commissary/Post Exchange (PX), must adhere to Site Cleanup Requirements (SCRs), per *Order No. R2-2003-0080, Revised Site Cleanup Requirements and Rescission of Order No. 91-082 and Order No. 96-070* (RWQCB, 2003). This new Order requires that the Presidio-Wide Quarterly Groundwater Monitoring Program report monitoring activities and findings, and publish chemical concentration plume maps of appropriate contaminants of concern semi-annually. This report is intended to comply with the requirements of the new Order.

1.1 Report Organization

This report is organized as described below.

- The Executive Summary presents a brief, concise synopsis of the most significant changes to the monitoring program and any significant findings, observations, and recommendations.
- The Main Body of the report presents the project background, the geologic and hydrogeologic setting, the groundwater monitoring procedures, the laboratory analyses, and the QA/QC procedures and findings. The main body of the report includes a site location figure and tables summarizing monitoring plans, sampling and analytical procedures and methods, and data validation procedures.
- Appendix A presents sections for each of the areas included in the program. Each section describes the site background and site-specific geologic and hydrogeologic setting, presents current and historical sampling results, and provides recommendations for modifications in future monitoring events. Each site section contains site-specific figures, tables summarizing analytical results, and monitoring well purge records.
- Appendix B contains completed equipment calibration forms.
- Appendix C contains groundwater-level measurement logs.
- Appendix D contains the laboratory analytical quality control (QC) reports for the Third and Fourth Quarters 2006 prepared by DataVal, Inc. (DataVal), the project data validation firm. Appendix D is included in electronic form on a compact disk (CD).
- Appendix E contains Curtis & Tompkins, Ltd. (Curtis & Tompkins) laboratory analytical data reports. Curtis & Tompkins was the designated primary laboratory for the Third and Fourth Quarters 2006. Appendix E is included in electronic form on a compact disk (CD).

- Appendix F contains Columbia Analytical Services (CAS) laboratory analytical data reports. CAS was the QC laboratory designated to analyze the QC duplicate samples for the Third and Fourth Quarters 2006. Appendix F is included in electronic form on a CD.

1.2 Field Sampling Plan

The groundwater monitoring activities documented in this report were performed in accordance with the *Field Sampling Plan, Presidio Groundwater Monitoring Project, Presidio of San Francisco, San Francisco, California* (FSP) (Treadwell & Rollo, 2001a) and the *Presidio-wide Quality Assurance Project Plan Sampling and Analysis Plan* (QAPP) (Tetra Tech, 2001). The FSP identified the groundwater elevation monitoring and sampling schedules, well locations, sampling procedures, and proposed analytical test methods. Standard operating procedures (SOPs) were presented for required monitoring tasks and for optional tasks such as well abandonment, which may be performed within the scope of the groundwater monitoring program. The *Base-wide Groundwater Monitoring Plan* (BGMP) (Montgomery Watson, 1996b) and site-specific corrective and remedial action plans (CAPs and RAPs) were also consulted in preparation of this report.

Modifications to the FSP may be required if the scope of work is modified, or if there are substantial revisions to the QAPP. If modifications to the FSP are required, a letter will be prepared which will include a brief discussion of the proposed changes and copies of revised tables and figures. The letter will be submitted to the NPS and appropriate regulatory agencies for review and comment. Minor adjustments may be made to the monitoring program depending on field conditions, and those changes will be documented in field logs and reported in the semi-annual reports.

1.3 Groundwater Monitoring Objectives

The general objectives of the Presidio-wide Groundwater Monitoring Program, as presented in the FSP, are as follows:

- Monitor the lateral and vertical extent of groundwater contamination.
- Track contaminant concentration and migration to help evaluate impacts to potential beneficial uses of groundwater.
- Provide data on contaminant concentration and migration needed for studies to evaluate potential exposure pathways to human and ecological receptors.
- Improve understanding of the Presidio geology and hydrogeology.
- Validate, optimize, and evaluate the effectiveness of groundwater remedial measures.

- Evaluate whether remedial objectives have been met.
- Provide the information necessary to establish and update long-term monitoring strategies.
- Provide groundwater monitoring reports with defensible data in accordance with the QAPP, SOPs, site-specific remedial plans and decision documents, and applicable regulatory agency requirements.

Site-specific monitoring objectives are identified in the site-specific sections presented in Appendix A.

2.0 BACKGROUND

The United States Department of Defense, Department of the Army (Army) operated the Presidio as a military base until 1994, when the Army closed this base and transferred the Presidio's administrative jurisdiction to the NPS. As part of the Army's responsibilities under base closure legislation, the Army initiated certain actions to address environmental conditions at the Presidio, including instituting the BGMP. The Army retained Montgomery Watson to prepare the BGMP and to conduct the groundwater monitoring program.

The Trust was established following passage of the Presidio Trust Act in 1996. The Trust negotiated with the Army to assume the Army's environmental cleanup responsibilities in order to expedite the environmental remediation efforts. The Trust retained Montgomery Watson to continue the Groundwater Monitoring Program through the Third Quarter 2000 and retained Treadwell & Rollo to perform the Presidio-wide Groundwater Monitoring Program beginning with the Second Quarter 2001.

3.0 GEOLOGIC AND HYDROGEOLOGIC SETTING

Tectonic activity in the San Francisco Bay Area, and the Presidio specifically, has resulted in an irregular topography of near-surface and surficial bedrock (referred to as the Franciscan Formation). Throughout the Presidio, the Franciscan Complex consists mostly of serpentinite that is typically overlain by relatively permeable units of poorly consolidated or unconsolidated sediments. These units are defined as (from oldest to youngest): the Merced Formation, the Colma Formation, the West Valley Clay, and dune sand.

The Merced Formation is a discontinuous unit, composed primarily of clay with low hydraulic conductivity. The Colma Formation overlies the Merced Formation, and overlies the Franciscan Formation bedrock in areas where the Merced is absent. The Colma Formation consists of horizontally bedded, fine-grained, slightly silty sand. A local, discontinuous clay deposit of unknown origin, referred to as the West Valley Clay, has been observed in a layer up to 30 feet thick overlying the Colma Formation. Dune sands are the most recent continuous unit deposited across the Presidio. Dune sands generally overlie the Colma Formation, but may also overlie the Franciscan, Merced, or West Valley Clay where erosion of the Colma Formation has occurred. The dune sands are generally well sorted, fine- to medium-grained, and yellow-brown to light gray in color.

Previous investigations have identified three groundwater basins at the Presidio. These basins are the Lobos Creek Groundwater Basin, the Coastal Bluffs Groundwater Basin, and the Marina Groundwater Basin (Figure 1). The Lobos Creek Groundwater Basin includes Lobos Creek, the principle perennial stream at the Presidio. The Marina Groundwater Basin includes the West Valley, Northeastern, and the Crissy Field Groundwater Areas (Montgomery Watson, 1996b). The Coastal Bluffs Groundwater Basin is not subdivided into groundwater areas.

The Lobos Creek Groundwater Basin is underlain by the Franciscan Formation and substantial thicknesses of relatively permeable, unconsolidated units. Several groundwater wells within this basin were used to supply a portion (approximately 10 percent) of the water used for former Presidio operations.

The Marina Groundwater Basin is the largest of the three basins at the Presidio. As mentioned above, this basin includes three groundwater areas, based on their geographic location. The Marina Groundwater Basin is underlain by all of the geologic units identified at the Presidio.

The Coastal Bluffs Groundwater Basin is the smallest of the three groundwater basins and is predominantly underlain by relatively impermeable serpentinite rock (Franciscan Formation) with minor amounts of overlying permeable materials. Groundwater yields in this basin are expected to be extremely low.

The BGMP was prepared in 1996 and has been supplemented by subsequent site-specific investigations. Summaries of geologic and hydrogeologic conditions encountered at each sampling area are presented in Appendix A.

4.0 GROUNDWATER MONITORING

The scope of field work for this report included collecting groundwater elevation measurements and samples from groundwater monitoring wells, piezometers, and seeps or springs at 17 areas at the Presidio (Figure 1). Tables 1A and 1B identify the elevation monitoring, sampling, and analyses schedules for wells, piezometers, seeps, and springs at each area for the Third and Fourth Quarters 2006, respectively. The 17 areas are:

1. Building 900s Area
2. Landfill 8
3. Fill Site 6
4. Battery Howe/Wagner
5. Building 1349 Area
6. Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, and Upgradient Wells
7. Landfill E
8. Landfill 4
9. Fill Site 5
10. Building 231/207 Area
11. Building 1065/1027 Area
12. Mini-CAP Areas
13. Nike Missile Facility
14. Baker Beach Disturbed Area 3
15. Landfill 10
16. Commissary/PX Area
17. Baker Beach Disturbed Areas 1 and 2A

4.1 Groundwater Elevation Monitoring

On 14 August and 4 December 2006, groundwater elevation measurements were collected, or groundwater seeps were evaluated for flow, at 209 and 114 wells, piezometers, or seeps, respectively. Tables 2A and 2B summarize the groundwater elevation measurements collected

during the Third and Fourth Quarters 2006, respectively. Groundwater elevations were measured using a Slope Indicator model #51453 or a Solinst model #101 water level meter. Copies of all field equipment calibration forms are included in Appendix B. A minimum of three measurements was taken at each well and recorded on the groundwater elevation log, as described in the SOPs. Copies of the groundwater-level measurement logs are included as Appendix C. The water level meters were decontaminated after each use by spraying them with an Alconox detergent solution, then rinsing with potable water, in conformance with the SOPs.

During the Third Quarter 2006, groundwater elevation measurements were collected at 209 monitoring wells, piezometers and/or seep locations on 14 August 2006 (Table 2A). Tidal elevations at the Golden Gate Tidal Station on 14 August 2006 are shown on Figure 2A. The following monitoring locations, UBR01GW01, 1065PZ6B, LF10GW02, and LF10SP01 were not located or were inaccessible during the Third Quarter 2006 and therefore, no groundwater elevation measurement was collected. Additionally, the following wells or piezometers did not contain water and the following seeps were not flowing during the Third Quarter 2006; HWGW102, LF5SP01, DAESP03, BB2ASW100, BB3PZ101, BB3SW102, and BB3SW104. Monitoring wells 600GW101 and LF6GW104 were abandoned prior to the Third Quarter 2006 as part of the ongoing remedial actions at the Commissary/PX Area and Fill Site 6A and therefore, were not measured for groundwater elevation.

During the Fourth Quarter 2006, groundwater elevation measurements were collected at 114 monitoring wells, piezometers and/or seep locations on 4 December 2006 (Table 2B). Tidal elevations at the Golden Gate Tidal Station on 4 December 2006 are shown on Figure 2B. Prior to Fourth Quarter 2006, the frequency of water level/seep evaluation was reduced to annual to match the sampling frequency at many sites, including: Landfill 8, Building 900s Area, Fill Site 1, Landfill 2, Fill Site 5, Commissary/PX Area, Landfill E, Upgradient Area, and Tennessee Hollow. In addition, nine wells, piezometers or seeps (DAESP03, HWGW102, LF4GW101, BB2ASW100, BB3PZ101, BB3PZ102, BB3SW102, BB3SW104, and HWGW102) were found either to be dry or to contain an insufficient amount of water to measure (i.e., water was trapped in the well end-cap and therefore was not representative of the aquifer). Monitoring well 1349MW102 and piezometer 1065PZ6A were not located or were inaccessible during the Fourth Quarter 2006. The conditions at these wells and seeps are identified in Table 2B.

4.1.1 Groundwater Elevation Monitoring at Tidally Influenced Wells

During the Third Quarter 2006, low and high tides were predicted to be at 4:20 AM and 10:55 PM on 14 August 2006, respectively. Observed low tide on 14 August 2006 was at 4:42 AM with a magnitude of 0.79 feet above Presidio Lower Low Water (PLLW). Observed high tide on 14 August 2006 was at 11:18 PM with a magnitude of 6.26 feet above PLLW. The Third Quarter 2006 predicted and observed tidal times and magnitudes are presented in the notes on Table 2A.

During the Fourth Quarter 2006, low and high tides were predicted to be at 4:58 PM and 9:58 AM on 4 December 2006, respectively. Observed low tide on 4 December 2006 was at 4:54 PM with a magnitude of -1.56 feet above PLLW. Observed high tide on 4 December 2006 was at 10:00 AM with a magnitude of 6.93 feet above PLLW. The Fourth Quarter 2006 predicted and observed tidal times and magnitudes are presented in the notes on Table 2B.

During the Third Quarter 2006, depth to groundwater measurements were collected between 11:50 AM and 13:21 PM on 14 August 2006 at the Building 900s and Commissary/PX Areas, which the Trust has determined are tidally influenced. Figure 2A shows graphical tide plots for the Golden Gate Tidal Station on 14 August 2006.

During Fourth Quarter 2006, tidal influence was not a factor during water level measurements as potential tidally influenced locations had been reduced to annual measurement prior to Fourth Quarter 2006.

Varying degrees of tidal lag may exist at site wells, causing groundwater elevations within monitoring wells to vary and to not necessarily be synchronized to the tidal schedule. The “tidal lag” is the length of time between a tidal extreme and the maximum influence measured in a well. The distance inland from the nearest tidally influenced surface water body is used to determine the tidal lag. In a homogeneous aquifer, the tidal lag time should be directly proportional to the distance from the surface water body. Variations in the tidal lag may be due to aquifer heterogeneity or the presence of man-made structures. At Crissy Field, the shallow aquifer may be hydraulically connected to the tidal marsh, whereas the intermediate and deeper aquifer may be hydraulically connected to the San Francisco Bay, though these relationships have not been specifically characterized.

4.2 Groundwater Sampling

The equipment and methods described in the FSP are summarized below. Groundwater samples were collected in laboratory-supplied sample containers, sealed, labeled, and placed into ice chests containing a sufficient volume of ice to maintain a temperature of 4.0 degrees Celsius (°C) for transport to the offsite analytical laboratories, in accordance with the methods described in the FSP. All samples were documented with chain-of-custody protocols, as described in the chain-of-custody SOP. The site-specific sections in Appendix A present details of well, piezometer, and seep sampling.

During the Third Quarter 2006, three groundwater sampling crews purged and/or sampled 46 wells, piezometers, and groundwater seeps between 16 August and 18 August 2006. The following monitoring wells, piezometers, and/or groundwater seeps LF5SP100, DAESP03, NKGW03, BB2ASW100, BB3GW101, BB3PZ101, BB3PZ102, BB3SW100, BB3SW101, BB3SW102, BB3SW104, HWGW102, LF6GW104, LF10GW02, and LF10SP01 were either dry

or did not contain a sufficient amount of water for sampling during the Third Quarter 2006. The Commissary/PX Area monitoring locations 600GW101, 600GW105, 600GW106, 600GW108, 610GW101 through 610GW103, 610SP01 and 610SP02 were not sampled during the Third Quarter 2006 due to the ongoing corrective action that was taking place at the time of sampling. Commissary/PX Area seep 610SP01 was sampled even though it was not proposed for sampling because a petroleum-like sheen was observed in the area of this seep. The results of this sampling are detailed in Appendix A section A-16.

During the Fourth Quarter 2006, three groundwater sampling crews purged and/or sampled 36 wells, piezometers, and groundwater seeps between 4 December and 6 December 2006. The following monitoring wells, piezometers, and/or groundwater seeps (DAESP03, BB2ASW100, BB3GW101, BB3PZ101, BB3PZ102, BB3SW100, BB3SW101, BB3SW102, BB3SW104, and HWGW102) were either dry or did not contain a sufficient amount of water for sampling during the Fourth Quarter 2006.

4.2.1 Groundwater Purging Methods and Selection Criteria

The following sections describe the groundwater purging methods and selection criteria that were used during this quarter.

4.2.1.1 Groundwater Purging Methods

Two primary groundwater well purging methods, normal and low flow, were used during the Third and Fourth Quarters 2006 and are described below. Tables 1A and 1B identify the sampling methods that were proposed for each well. If field conditions required any changes from the proposed methods, those changes are described in the site-specific summaries in Appendix A.

Normal – This method involves purging until three borehole volumes of groundwater have been extracted or until groundwater parameters have stabilized, whichever is greater. Table 3 identifies well construction details required to calculate the borehole volumes for each well. Table 4 shows the precalculated volume of water in a 1-foot section of various borehole and casing sizes. For low-yield wells that require slower pumping rates than would be used with the normal method, Tables 1A and 1B identify a modified normal method, which is the same as the normal method except that a maximum purging rate of 0.5 gallons per minute (gpm) is designated. If the well is able to sustain a 0.5 gpm purge rate, well purging is considered complete after groundwater parameters have stabilized. If a well is purged dry using the normal or modified purging methods, the groundwater level is allowed to recharge to within 80 percent of its pre-purging elevation prior to sampling. Additional details on this method are presented in the FSP.

Low Flow – This method involves purging at a rate as low as 0.02 gpm in order to minimize groundwater sample disturbance. Additional details on this method are presented in the FSP.

4.2.1.2 Groundwater Purging Method Selection Criteria

The Trust has determined which purging method to use at each well using the following selection criteria:

1. Whenever possible, wells should be purged using the normal method.
2. To help maintain data comparability, the purging method for a well should remain consistent from quarter to quarter except as noted below.
3. If a well is pumped dry or shows a significant drop in the groundwater elevation using the normal method and requires a slower pumping rate, the modified normal purge method will be used. This change to a slower pumping rate can be made during purging, depending upon groundwater recharge conditions.
4. If a well is pumped dry using the modified normal method and requires a slower pumping rate, the low-flow purge method will be used. This method requires specialized equipment and has the potential to affect data comparability, so changes to this method would only occur with Trust approval prior to future quarterly sampling.
5. When not conflicting with criteria 1 through 4, all wells at a single site screened in the same zone shall be purged using the same method.

4.2.2 Groundwater Sampling Methods

The sampling methods used following purging are described below.

4.2.2.1 Groundwater Sampling Methods After Normal Purging

Following normal purging, groundwater samples were collected using a new disposable bailer, a 2-inch-diameter Grundfos Redi-Flow™ or a peristaltic pump, and decanted into the appropriate laboratory-supplied containers. Monitoring wells that are sampled using either a 2-inch Redi-Flow™ or peristaltic pump may have dedicated tubing associated with them. Dedicated tubing is stored at the Central Magazine in new plastic bags after each use.

4.2.2.2 Groundwater Sampling After Low-Flow Purging

Following low-flow purging, groundwater samples were collected using either a peristaltic pump or a 2-inch Redi-Flow™ pump. Monitoring wells that are sampled using either a 2-inch

Redi-Flow™ or peristaltic pump may have dedicated tubing associated with them. Dedicated tubing is stored at the Central Magazine in new plastic bags after each use.

4.2.2.3 Sampling at Seeps

Nine seep and fixed monitoring locations were identified for sampling as part of this program during the Third and Fourth Quarters 2006 (Tables 1A and 1B). Because spring and seep locations can change over time, the sample locations were identified by the Trust.

Three Baker Beach Disturbed Area 3 (BBDA 3) fixed surface water seep monitoring points, BB3SW100, BB3SW101, and BB3SW102, were installed on 8 and 23 May 2005 at depths of 2.5, 3.0, and 2.5 feet bgs, respectively. The fixed monitoring points are purged prior to sampling, in accordance with the 'modified' method of sampling described in Section 4.2.2.1 above.

One seep sample (610SP01) was collected during the Third Quarter 2006, in accordance with procedures presented in the FSP. Seeps and fixed monitoring points (LF5SP100, DAESP03, BB2ASW100, BB3SW100, BB3SW101, BB3SW102, and BB3SW104) were not flowing or did not contain a sufficient amount of water during the Third Quarter 2006 and were not sampled. In addition, LF10SP01 was inaccessible for sampling and therefore, no samples were collected at this location during the Third Quarter 2006.

One seep sample (LF10SP01) was collected during the Fourth Quarter 2006, in accordance with procedures presented in the FSP. Seeps and fixed monitoring points (DAESP03, BB2ASW100, BB3SW100, BB3SW101, BB3SW102, and BB3SW104) were not flowing or did not contain a sufficient amount of water during the Fourth Quarter 2006 and were not sampled.

During the Third and Fourth Quarters 2006, all seep samples were analyzed for dissolved metals and total metals, as requested by the DTSC.

4.3 Sample Preservation, Handling, and Transportation

Samples were collected in laboratory-supplied sample containers, sealed, labeled, and placed into an ice chest containing a sufficient volume of ice to maintain a temperature of 4.0 °C (plus or minus 2.0 °C) for transport to the offsite analytical laboratories, in conformance with procedures presented in the FSP. Temperature blanks were included in coolers for measurement by the laboratory upon receipt.

4.3.1 Sample Labels and Chain-of-Custody Documentation

Sample labels for each container were preprinted on adhesive paper prior to beginning sampling operations. Prior to sampling, each field team was designated a number (e.g., 1 through 4 in the

case of four sampling teams) for the duration of the sampling event. The samples were identified according to the numbering scheme described in the FSP, with the following modifications.

- The FSP specified that trip blanks be identified as TB and the date. When multiple trip blanks were generated by different sampling crews on the same date, the number assigned to the field crew collecting the sample (1, 2, 3, or 4) and a letter (i.e., A, B, C, etc.), indicating which sample of the day it was for that team, were added to the sample identification to ensure that all trip blanks had unique identifications. For example, trip blank TB081606A was the first trip blank collected on 16 August 2006 by field crew number 1.
- The FSP specified that duplicate samples be identified as duplicate (DUP) and the date. When multiple duplicate samples were generated by different sampling crews on the same date, the same labeling methodology described above for trip blanks was applied to the duplicates. The number assigned to the field crew collecting the sample and a letter (i.e., A, B, C, etc.), indicating which sample of the day it was for that team, were added to the sample identification to ensure that all duplicates had unique identifications. For example, duplicate sample DUP0816062A was the first duplicate sample collected on 16 August 2006 by field crew number 2.

After labeling, each sample's requested laboratory analyses were recorded on individually numbered triplicate chain-of-custody forms. The sample coolers and chain-of-custody forms were kept in the possession of the samplers or in a secure, locked location prior to pickup by the laboratory courier.

All samples login summaries are reviewed as samples are received by the laboratories and changes to sample identifications are typically documented in laboratory reports (Appendices E and F). All samples were correctly labeled during the Third and Fourth Quarters 2006 and did not require changing.

4.3.2 Filtration of Groundwater Samples for Metals Analyses

Beginning in the Second Quarter 2001 and through the Third Quarter 2002, all groundwater samples collected for dissolved metals analyses were filtered in the field with a 0.45-micron, Clearwater Engineering™ filter prior to being placed in preserved containers. For reasons discussed below in Section 5.4.3.4, a different brand of filter was selected beginning in the Fourth Quarter 2002.

Beginning in the Fourth Quarter 2002, all groundwater samples collected for dissolved metals analyses were filtered in the field with a 0.45-micron, high-capacity polyethersulfone QED

Quickfilter™ prior to being placed in preserved containers. The filters were flushed with at least 200 milliliters of sample water prior to collecting the sample, which adheres to the manufacturer's instructions. For wells being analyzed for total dissolved solids (TDS), analyses were also performed using the filtered sample.

At DTSC's request and beginning in the Second Quarter 2003, both dissolved (filtered) and total (unfiltered) metals samples were collected at seep and fixed monitoring point locations. The total metals results are applicable for use in health risk assessments, but are not representative of dissolved metal conditions in groundwater.

All dissolved metals samples collected during the Third and Fourth Quarters 2006 were filtered using QED Quickfilters™.

5.0 LABORATORY ANALYSES

5.1 Analytical Methods

Table 5 lists the types of analyses, analytical methods, sample container types and volumes, preservatives used (if applicable), and the maximum allowable holding times prior to extraction for each analysis. The following carbon ranges were used for total petroleum hydrocarbon (TPH) analyses and are summarized in Table 5.

- TPH as gasoline (TPHg, carbon range C7–C12). This carbon range was specified by the QAPP.
- TPH as stoddard solvent (TPHss, carbon range C7–C12). TPHss analyses were added to the Presidio-wide Groundwater Monitoring Program beginning with the First Quarter 2004 at the request of the Trust. The carbon range for TPHss is not specified in the QAPP. TPHss is a specialized formulation of TPHg and is found in the same carbon range as TPHg. Laboratory quantification for TPHss is achieved by comparing the shape of the analytical chromatogram within the same carbon range as TPHg for a diagnostic combination of spikes.
- TPH as diesel (TPHd, carbon range C12–C24). This carbon range was specified by the QAPP.
- TPH as fuel oil (TPHfo, carbon range C24–C36). No carbon range for TPHfo was specified by the QAPP. At the request of the Trust, TPHfo is qualified by the laboratory using the TPH as motor oil (TPHmo) standard and the QAPP carbon range for TPHmo. This issue is discussed in more detail in Section 5.4.3.1.

Table 6 lists compounds of potential concern (COPC) identified in the QAPP and analytical reporting limits for COPCs in the groundwater monitoring program. Several water quality criteria are summarized in Table 6 for comparison with the laboratory reporting limits. The water quality criteria presented in Table 6 do not necessarily represent cleanup criteria for Presidio sites.

The analytical methods for some metals and polycyclic aromatic hydrocarbons (PAHs) were changed from those identified in the FSP in order to reach the lower reporting limits identified in the QAPP. The following changes, approved by the Trust, were made.

- Twelve metals (antimony, arsenic, barium, beryllium, cadmium, copper, chromium, cobalt, nickel, silver, thallium, and zinc) were analyzed using Environmental Protection Agency (EPA) Method 6020 instead of EPA Method 6010 as proposed in the FSP between the Second Quarter 2001 and the First Quarter 2003. Beginning in

the Second Quarter 2003, seven of these metals (arsenic, barium, beryllium, chromium, cobalt, nickel and zinc) were granted variance by the stakeholders from the QAPP reporting limits and were analyzed using EPA Method 6010.

- PAHs were analyzed using EPA Method 8310 instead of EPA Method 8270 as proposed in the FSP.

Four emergent chemicals (perchlorate, N-nitrosodimethylamine [NDMA], 1,4-dioxane and polybrominated diphenyl ether [PBDE]) were added to the First Quarter 2004 groundwater monitoring event at the request of the RWQCB. As listed on Table 5, analytical methods for the emergent chemicals are:

- Perchlorate, EPA Method 314.0;
- NDMA, EPA Method 1625;
- 1,4-dioxane, using EPA Method 8270C; and
- PBDE, EPA Method 1614.

NDMA was the only emergent chemical analyzed during the Third Quarter 2006. No samples were analyzed for the four emergent chemicals during the Fourth Quarter 2006.

5.2 Analytical Data Delivery Methods

The analytical laboratories submitted all analytical reports in paper and electronic formats to Treadwell & Rollo. Both the electronic and paper copies were forwarded to DataVal. DataVal reviewed both the electronic and paper data, and prepared two Data Validation Summary Reports (QCSR) dated 29 November 2006 and 19 February 2007. The reports entitled, *Data Validation Summary Report for the Third Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA* and *Data Validation Summary Report for the Fourth Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA*, respectively, are discussed in Section 6.1 and attached as Appendix D.

5.3 Analytical Results

The tables in this report that present new analytical data were generated from laboratory-supplied EDDs, after the EDDs had been validated by DataVal and imported into the project database. Analytical summary tables were prepared for each site and are presented in Appendix A.

5.4 Analytical Data Comparability

One of the goals of this Groundwater Monitoring Program has been to establish standards for groundwater sampling and analytical methods that provide a high degree of data comparability among different wells throughout the Presidio, and between the current and historical data collected at the same well. The primary variables that can influence data comparability are the field methods, sampling methodology, the types of analyses performed, and the analytical methods used by the laboratory. These issues are discussed below.

5.4.1 Field Methods

To assist with data comparability, the FSP established Presidio-wide standard well purging and sampling methods, and criteria for selecting purging methods, as described in Section 4.2. The selection criteria include evaluating the historical purging and sampling methods at a particular well and at other wells within a single site.

To assist with comparability of data collected from direct-reading field instruments, this program has attempted to employ similar methods and instrumentation at wells purged using the same method.

5.4.1.1 Dissolved Oxygen

Dissolved oxygen (DO) results are discussed in the individual site-specific sections in Appendix A. In general, wells purged with the low-flow method used an in-line oxygen probe. Wells purged with the normal method have used a downhole oxygen probe since the Third Quarter 2001. During the Second Quarter 2001, DO was recorded with either a downhole probe or a surface instrument in wells purged with the normal method. The surface instrument generally recorded higher DO concentrations than the downhole instrument because of water turbulence caused by collecting the sample with a bailer.

Beginning in the Second Quarter 2002, in an effort to increase the accuracy and precision of the DO measurements being collected in the field, additional protocols were added to the existing calibration procedure (i.e. calibrating to 100% air saturation) and measurement method, where appropriate. Each field team measures the DO concentrations simultaneously within a single, randomly selected monitoring well with their respective DO meters. This protocol is performed once per week throughout each event and the measured values are recorded on a calibration record (Appendix B). The recorded values are used to evaluate the precision between DO meters. If a significant difference between DO meters is observed, a correction factor can be used to ensure that relative values between sampling teams are comparable.

Another field protocol used involves lowering the down-hole DO meter probe slowly to the middle of the screened interval in each well before recording the DO measurement. This

protocol ensures that the relatively disturbed and aerated water near the top of the water column is not measured. This protocol does not apply to wells sampled using the low flow sampling method, because those wells are measured using a flow-through-cell at the surface.

These additional protocols have produced significantly more stable, and generally lower, DO measurements when compared to historical values.

5.4.2 Analytical Suite

To assist with data comparability, the analytical suite for each well was selected for consistency with previous analyses conducted by others. Additionally, analytes were added to provide greater consistency with the analytical suite for all wells at a site and with wells at adjacent sites.

5.4.3 Analytical Methods

To assist with data comparability, the laboratory analytical methods used, beginning in the Second Quarter 2001, generally remained the same between subsequent quarters, and these methods were similar to most of the methods previously used by others. A significant change from previous TPH analyses was the introduction of carbon ranges specified in the QAPP that differ from previous ranges. Additional significant changes from previous analytical methods involved PAH compounds and 12 metals, as described in Section 5.1.

5.4.3.1 TPH Analyses

The TPH analytical methods used during the Third and Fourth Quarters 2006 are the same as those used in recent quarterly sampling events. However, historical TPHfo analyses used a carbon range of C₂₄-C₃₆, which the QAPP states should be called TPHmo. During the Second and Third Quarters 2001, TPH within the C₁₂-C₅₀ and C₂₄-C₃₆ carbon ranges were reported as TPHfo and TPHmo, respectively. Beginning in the Fourth Quarter 2001, TPH within the C₂₄-C₃₆ carbon range is reported as TPHfo in order to conform with the reporting convention used prior to the Second Quarter 2001.

It is a standard procedure in this monitoring program to use silica gel cleanup EPA Method 3630A to remove non petroleum-based hydrocarbons in all TPHd, TPHmo, and TPHfo analyses. For Third Quarter 2001, EPA Method 3630A was requested for all TPHd, TPHmo, and TPHfo analyses on the chain-of-custody forms, but the primary laboratory mistakenly did not perform the silica gel cleanup for most of these analyses. For Second Quarter 2002, the QC laboratory mistakenly did not perform the silica gel cleanup for the sample from monitoring well 937GW42. Performing TPH analyses without using a silica gel cleanup to remove non petroleum-based hydrocarbons can lead to elevated TPH concentrations, due to the quantification of naturally occurring hydrocarbons as TPH. This is especially true for sites underlain by material with very

high organic content, such as the shallow Bay Mud present in portions of Crissy Field. Previous groundwater monitoring reports have described this issue and presented justification for why the TPH detections in samples run without the silica gel cleanup are not representative of petroleum-based hydrocarbons, and why this data is not being relied upon (Treadwell & Rollo, 2002b, 2002d, 2002f, 2002g, 2002h).

All of the samples with detections of TPHd, TPHfo, and TPHmo, which were not run with the silica gel cleanup, were qualified with an 'NJ' by DataVal. The USEPA National Functional Guidelines for Organic Data Review defines 'NJ' as follows: "The analysis indicates the presence of an analyte that has been 'tentatively identified' and the associated numerical value represents its approximate concentration."

Per Trust request, monitoring well 1047MW100 was sampled for TPHss beginning in Fourth Quarter 2003.

5.4.3.2 Xylene Analyses

Beginning in the Fourth Quarter 2001, xylenes were reported as total xylenes in order to conform to the reporting convention used prior to the Second Quarter 2001. During the Second and Third Quarters 2001, xylenes were reported as m,p-xylenes and o-xylenes, because the QAPP identified reporting limits for these compounds only and not for total xylenes. The sum of the concentrations of m,p-xylenes and o-xylenes is equivalent to total xylenes. The reporting limit for total xylenes is 0.5 micrograms per liter ($\mu\text{g/L}$), the same as currently being used for the two xylene compounds.

5.4.3.3 PAH Analyses

The new method used for PAH compounds beginning in the Second Quarter 2001 (EPA Method 8310) has lower detection limits than the previous method (EPA Method 8270). EPA Method 8310 analytical data generally confirms historical findings that detectable concentrations of PAHs are not present at most sites.

5.4.3.4 Metals Analyses

The new method used to analyze 12 metals beginning in the Second Quarter 2001 (EPA Method 6020) has lower detection limits than the previous analytical method (EPA Method 6010). A description of the differences between these methods was included in previous reports (Treadwell & Rollo, 2002c, 2002e).

Results using EPA Method 6020 showed detectable concentrations of some metals for the first time in some wells, such as antimony and arsenic, beginning in the Second Quarter 2001. For metals such as antimony and arsenic, the detected concentrations were generally lower than the historical reporting limits. Analytical results measured between the Second Quarter 2001 and

the Third Quarter 2002 indicated that some zinc concentrations and the majority of barium concentrations were higher than historically reported.

The reason for the increases in barium and zinc concentrations between the Second Quarter 2001 and the Third Quarter 2002 was determined to be a result of the brand of filter used, as discussed in the *Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2004* (Treadwell & Rollo, 2004c).

6.0 QUALITY ASSURANCE, QUALITY CONTROL, AND DATA VALIDATION

The QA/QC program for this project is designed to verify that the information presented in this report is based upon accurate and reliable laboratory analytical data. The program includes the collection and analyses of many types of QA/QC samples, including duplicates (Table 7), equipment rinsate blanks (Table 8), trip blanks (Table 9) source water blanks (Table 10), and running matrix spike/matrix spike duplicate (MS/MSDs) to ensure that the analytical laboratories perform and document all required calibrations and internal QA/QC procedures.

Overall, the project data quality objectives have been met for the Third and Fourth Quarters 2006. Where data have required qualification, a discussion is provided in each quarterly data validation report and in each site-specific section. The following sections describe the data validation procedures and the results of the QA/QC sample evaluation for both the Third and Fourth Quarters 2006.

6.1 Data Validation

DataVal reviewed both the electronic and paper data, and prepared Data Validation Summary Reports (DVSR) dated 29 November 2006 and 19 February 2007. The reports entitled, *Data Validation Summary Report for the Third Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA* and *Data Validation Summary Report for the Fourth Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA*, respectively, are attached as Appendix D. The reports evaluate the relative percent difference (RPD) for the duplicate samples from Curtis & Tompkins and QC duplicates from CAS, and the following QC data (where applicable) for each analytical method.

- Reporting limits
- Holding times
- Target blanks
- Gas chromatograph/mass spectrometer equipment tunes
- Initial equipment calibration
- Continuing equipment calibration
- Matrix spike/matrix spike duplicate
- Laboratory control samples
- Surrogate recoveries
- Internal standards

The following data validation qualifiers used by DataVal and shown in our tables are those recommended in *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review* (EPA, 1999).

- U The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- Jb The analyte was identified below the laboratory reporting limit but above the laboratory method detection limit and QAPP-specified reporting limit.
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a “tentative identification.”
- NJ The analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. The presence or absence of the analyte cannot be verified.

Table 11 summarizes the data qualifiers used during these events and previous Treadwell & Rollo sampling events.

6.2 Quality Assurance and Quality Control Sampling

Field QC samples include duplicates, QC duplicates, equipment rinsate blanks, field blanks, and trip blanks. The following sections summarize the QA/QC samples that were collected during the Third and Fourth Quarters 2006.

6.2.1 Duplicate Samples

Duplicate groundwater samples were collected on a minimum schedule of 1 duplicate per 10 samples (10 percent) for the primary laboratory (Curtis & Tompkins), and 1 duplicate per 20 samples (5 percent) for the duplicate QC laboratories (CAS). Duplicate groundwater samples were collected using the same methods as the primary samples, as described in the FSP. The duplicate samples were analyzed for the same suite of analytes as the primary samples.

Third Quarter 2006

For the Third Quarter 2006, 46 primary samples were collected for analyses. Eight duplicate samples (17 percent) were analyzed by the primary laboratory and four QC duplicate samples (9 percent) were analyzed by the QC duplicate laboratory (CAS). The relative percentages of duplicate and QC duplicate samples collected are typically higher than the QAPP requirements in order to attain sufficient duplicates for each analysis. Table 7 summarizes the sample identifications and analyses for the duplicate samples. The analytical results for the duplicates are presented in the site-specific analytical tables in Appendix A.

Fourth Quarter 2006

For the Fourth Quarter 2006, 36 primary samples were collected for analyses. Six duplicate samples (17 percent) were analyzed by the primary laboratory and four QC duplicate samples (11 percent) were analyzed by the QC duplicate laboratory (CAS). The relative percentages of duplicate and QC duplicate samples collected are typically higher than the QAPP requirements in order to attain sufficient duplicates for each analysis. Table 7 summarizes the sample identifications and analyses for the duplicate samples. The analytical results for the duplicates are presented in the site-specific analytical tables in Appendix A.

6.2.1.1 Duplicate Sample Analytical Results

The field and primary laboratory duplicate precision was evaluated by collecting duplicate samples, as described in the FSP, submitting the samples blind to Curtis & Tompkins for analyses, and then calculating the RPD between the detected results in the sample and its duplicate. This evaluation assumes that the water sample collected from a well is homogenous.

The control limit of 50 percent or less was used for the RPDs to determine whether project data quality objectives were being met. RPDs are calculated for two samples by subtracting the concentration of Sample One from the concentration of Sample Two and then dividing this result by the average of the two concentrations.

Third Quarter 2006

The overall correlation of analytical results met project data quality objectives. All analytes in each duplicate pair met the RPD control limit requirements, except for the following:

- In field duplicates 1213GW101 and DUP0816063A, the RPD between the detected results failed the 50% acceptance criteria for ethylbenzene at -51%, and gasoline at -78%.

- In field duplicates BB3GW100 and DUP0815061A, the absolute difference between the results was greater than the reporting limit for dissolved manganese. The original result for dissolved manganese was 24 µg/L and the duplicate result was non-detect at 10 µg/L.

The *Data Validation Summary Report for the Presidio Trust Groundwater Monitoring (DVSR)* Third Quarter 2006 (Appendix D) discusses the duplicate sample RPD results, the analytical results and RPD calculations (Table 3). Data was not qualified by DataVal due to RPD failure of duplicate samples because the effect on the quality of the data is not known.

Fourth Quarter 2006

The detected results of the original sample and the associated duplicate sample were compared and the calculated RPDs reported. All RPDs met the 50 percent precision control limit requirement.

The DVSR Fourth Quarter 2006 (Appendix D) discusses the duplicate sample RPD results, the analytical results and RPD calculations (Table 3).

6.2.1.2 Quality Control Duplicate Sample Analytical Results

The laboratory-to-laboratory duplicate precision was evaluated by collecting QC duplicate samples and submitting the primary duplicate sample to Curtis & Tompkins and a QC duplicate sample to CAS. All the QC duplicate samples submitted the QC laboratory had the same sample identification as the primary sample, with a “CL” added to the end. The relative precision was evaluated by calculating the RPD between the detected results in the duplicate sample and its QC duplicate. This evaluation assumes that the water sample collected from a well is homogenous.

The control limit of 50 percent or less was used for the RPDs to determine whether project data quality objectives were being met.

Third Quarter 2006

The overall correlation of analytical results between the two laboratories met project data quality objectives. All analytes in each duplicate pair met the RPD control limit requirements, except for:

- In QC split duplicates 1213GW101 and 1213GW101CL, the RPD between the reported results failed the 50% RPD acceptance criteria for ethylbenzene at 109%, gasoline at 93%, nitrate-N at -158%, and sulfate at -162%.

- In QC split duplicates 1065MW9B and 1065MW9BCL, the RPD between the reported results failed the 50% RPD acceptance criteria for chloride at 84%, nitrate-N at 80%, and sulfate at 81%.

The DVSR Third Quarter 2006 (Appendix D) discusses the QC split sample RPD results, the analytical results and RPD calculations (Table 4). Data was not qualified by DataVal due to RPD failure of QC split samples because the effect on the quality of the data is not known (DataVal, 2006).

Fourth Quarter 2006

The overall correlation of analytical results between the two laboratories met project data quality objectives. All analytes in each duplicate pair met the RPD control limit requirements, except for the following:

- In QC split duplicates 1065MW9A and 1065MW9ACL, the RPD between the reported results failed the 50% RPD acceptance criteria for dissolved arsenic at 51%.

The DVSR Fourth Quarter 2006 (Appendix D) discusses the QC split sample RPD results, the analytical results and RPD calculations (Table 4). Data was not qualified by DataVal due to RPD failure of QC split samples because the effect on the quality of the data is not known (DataVal, 2007).

6.2.2 Equipment Rinsate Blanks

Up to one equipment rinsate blank (ERB) was collected per non-dedicated sampling device per day. Per the FSP, the ERBs were collected by pouring clean laboratory-supplied deionized water over the decontaminated sampling device and directly into the sampling container. Table 8 summarizes the analytical results for the ERB samples.

Third Quarter 2006

During this sampling event, two ERB's were collected and submitted for the same analyses as the sample that the equipment was used to collect. The following analytes were detected in the ERB during the Third Quarter 2006.

- Equipment blank 1065MW9BRB9A had a detected level of sodium (600 µg/L). The associated sample had sodium values greater than 125 times the blank amount, and qualification was not required.

- Equipment blank BHWGW05RB01 had a detected level of alkalinity (1.5 mg/L). The associated sample had alkalinity values greater than 400 times the blank amount, and qualification was not required.
- Equipment blank BHWGW05RB01 had a detected level of calcium (770 µg/L). The associated sample had calcium values greater than 90 times the blank amount, and qualification was not required.

Fourth Quarter 2006

During this sampling event, one ERB was collected and submitted for the same analyses as the sample that the equipment was used to collect. The following analyte was detected in the ERB during the Fourth Quarter 2006.

- Equipment blank BHWGW04RBHWGW100 had a detected level of alkalinity (1.1 mg/L). The associated samples had alkalinity values greater than 280 times the blank amount, and qualification was not required.

6.2.3 Trip Blanks

The laboratory supplied 40-milliliter trip blanks with each shipment of volatile organic compound (VOC) sampling containers sent from the laboratory. One trip blank was included with each cooler containing field samples planned for VOC analyses. Table 9 summarizes the analytical results for the trip blank samples.

Third Quarter 2006

Three trip blank samples were received by the analytical laboratories and analyzed for VOCs. No VOCs were detected within any of the trip blank samples collected during this quarter.

Fourth Quarter 2006

Five trip blank samples were received by the analytical laboratories and analyzed for VOCs.

- Trip blank TB1206061A had a detected level of chloroform at 7.7 µg/L. All associated project samples were non-detect for chloroform, and qualification was not required
- Trip blank TB1207061A had a detected level of acetone at 22 µg/L. All associated project samples were non-detect for acetone, and qualification was not required

- Trip blank TB1207061B had a detected level of chloroform at 5.4 µg/L. All associated project samples were non-detect for dichloromethane, and qualification was not required

6.2.4 Source Water Blanks

Blaine Tech Services, Inc., the contractor who performed groundwater monitoring tasks, provided deionized water for decontamination purposes from the water deionization system at its San Jose facility. Source water blanks were collected from the outflow of the water deionization system and from the water tanks mounted on one of the sampling vehicles. The source water blanks were submitted to the primary laboratory for all analyses in the Groundwater Monitoring Program. Table 10 summarizes the analytical results for the source water blanks.

Third Quarter 2006

Source blank DW081706A was collected from the water tank on a sampling vehicle and had a detected level of sodium at 800 µg/L. The elevated concentration of sodium in this sample appears to be anomalous based on the non-detect value reported in the source blank collected from the water deionization system at Blaine Tech's facility in San Jose, California and the magnitude of the sample result. Third Quarter 2006 samples had sodium detected at concentrations ranging from 56,000 to 3,800,000 µg/L. It is unlikely that the 800 µg/L concentration detected in the source blank would have contributed to elevated sodium results in groundwater samples.

No other analytes were detected above laboratory detection limits within this source water sample during this quarter.

Source blank DW082106B was collected from the water deionization system and had detected levels of TDS at 50 mg/L and acetone at 16 µg/L. Third Quarter 2006 samples had TDS detected at concentrations ranging from 450 to 10,900 mg/L. It is not likely that 50 µg/L concentration detected in the source blank would have contributed to elevated TDS results in groundwater samples.

Acetone was not detected in any other project samples during the Third Quarter 2006 and therefore, this source water detection does not appear to have significantly affected data quality. No other analytes were detected above laboratory detection limits within this source water sample during this quarter.

Fourth Quarter 2006

A source blank was collected from the water tank on a sampling vehicle, but was mistakenly left of the chain of custody by the field team and the laboratory neglected to login the sample. The

error was discovered after a significant number of sample hold times had expired and therefore, the sample was not analyzed. The field team has been instructed to double check the chain of custody and field forms prior to submitting samples and the laboratory has been instructed to inform Treadwell & Rollo when samples are received but are not on the chain of custody in a more timely manner.

Source blank DW120606B was collected from the water deionization system and had detected levels of TDS at 30 mg/L. Fourth Quarter 2006 samples had TDS detected at concentrations ranging from 320 to 2,480 mg/L. It is not likely that concentration detected in the source blank would have contributed to elevated TDS results in groundwater samples. No other analytes were detected above laboratory detection limits within this source water sample during this quarter.

6.2.5 Temperature Blanks

Temperature blanks were included in coolers containing field samples sent to analytical laboratories, and the blank temperatures were recorded by the laboratory upon arrival. The QAPP specifies a temperature of 4.0 °C, plus or minus 2.0 °C.

Third Quarter 2006

The temperature of all nine temperature blanks sent to Curtis & Tompkins ranged from 2.4 to 5.8 °C, which is within QAPP requirements.

Fourth Quarter 2006

The temperature range of all 12 temperature blanks ranged from 2.0 to 3.8 °C except for five coolers sent to Curtis & Tompkins, which had temperatures ranging from 1.1 to 1.7 °C upon arrival. The slightly lower blank temperature is not considered to be significant.

6.2.6 Matrix Spike and Matrix Spike Duplicate Samples

Three times the normal amount of sample volume was collected on every twentieth groundwater sample for MS/MSD analysis. The MS/MSD results for the various analytical methods were evaluated by DataVal and discussed in the DVSRs, which are attached as Appendix D.

7.0 FIELD WORK DOCUMENTATION

This section describes the field documentation prepared for this sampling event, in conformance with the FSP. Field personnel are responsible for recording field activities on the appropriate field documentation form in sufficient detail to allow reconstruction of the sampling event without relying on memory. The location of completed field documentation forms and logs described in the FSP and used during this sampling event are described below.

- Field Instrument Calibration Logs (located in Appendix B and project files)
- Health & Safety Meeting Form (located in project files)
- Groundwater Level Measurements Logs (located in Appendix C and project files)
- Monitoring Well Sampling Logs (located at the end of each site-specific section in Appendix A and in project files)
- Chain-of-Custody Forms (located in Appendices E and F and project files)
- Field Investigation Daily Reports (located in project files)
- Bound Field Book (located in project files)
- Field Audit Forms (located in project files)

8.0 DISPOSAL OF PURGE AND DECONTAMINATION WATER

All water purged from wells and used for decontamination during the Third and Fourth Quarters 2006 was collected and stored in two 2,800-gallon polyethylene above ground storage tanks located at the Central Magazine. A purge water sample was not collected following the Third Quarter 2006 because the amount of purge water generated during the event did not warrant this sample to be collected. The purge water was stored in the tanks until following the Fourth Quarter 2006.

On 14 December 2005, water sample WT121405 was collected from the water tanks with laboratory-supplied containers and submitted to the primary laboratory for the analytes required by the City of San Francisco for batch discharge into the sanitary sewer system. Table 12 summarizes the analyses required by the City of San Francisco and the analytical results. The laboratory data reports are in Appendix E. All results were below discharge criteria. Trust personnel discharged the water to the sanitary sewer.

Building 1349	1349MW01	Q	Modified	Truck	1		Q1					Q1 (23)			Q1	Q1	Q1	Q1			Q1		Q1					Q1	Q1	Q1		The reduction to annual sampling at wells (1349MW01, and 1349MW103 through 1349MW105) not serving as upgradient monitoring points for Fill Site 5 (per the Fill Site 5 RAP) until the Building 1349 Area CAP has been implemented. finalized was approved by the stakeholders prior to First Quarter 2004 based on the lack of significant detections. ORP is measured for the evaluation of redox conditions, in accordance with recommendations from the Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites (pending). Sampling at 1349MW02 has been reduced to annual until the Building 1349 Area CAP has been implemented. This change is in accordance with the Fill Site 5 RAP and is consistent with other like Building 1349 Area wells. TPH, PAHs, VOCs, PCBs, chlorinated herbicides, general chemistry parameters, TDS, and dissolved metals (see Attachment 1 for a discussion of chromium results) have met their post-remediation groundwater monitoring requirements and cleanup levels from the Fill Site 5 RAP for the required frequency of monitoring within 1349MW03R, 1349MW101, and 1349MW102 and were approved for removal prior to the Second Quarter 2006. The Trust requests cessation of these analytical compounds from the Groundwater Monitoring Program at Fill Site 5+ Building 1349 (including 1349MW03R, 1349MW101, and 1349MW102) prior to the Second Quarter 2006 (see Attachment 1). It is noted that these three wells will be monitored per requirements of the Building 1349 Area CAP, once it is finalized and implemented.

Baker Beach Disturbed Area 3	BB3GW100	Q	Modified	Hand	1		Q					Q (22)			Q	Q												Q	Q	Q	Groundwater analyses are conducted in general accordance with the Baker Beach Disturbed Area 3 RAP. Fixed monitoring points BB3SW100 through BB3SW102 are sampled using a disposable bailer and are purged prior to sampling, in accordance with the modified method of purging.	
Baker Beach Disturbed Area 3	BB3GW101	Q	Modified	Hand	1		Q					Q (22)			Q	Q											Q	Q	Q			
Baker Beach Disturbed Area 3	BB3PZ101	Q	Modified	Hand	1		Q					Q (22)			Q	Q											Q	Q	Q			
Baker Beach Disturbed Area 3	BB3PZ102	Q	Modified	Hand	1		Q					Q (22)	Q (22)		Q	Q												Q	Q	Q	In accordance with the RAP, TPH analyses were reduced to semi-annual sampling at BB3SW101 and BB3SW102, as no TPH detections have occurred for four quarterly events. For metals, chromium exceeded the cleanup level during the Fourth Quarter 2005 at BB3SW102; thus, all seeps will continue to be analyzed on a quarterly basis for metals and general chemistry parameters. At BB3GW101, BB3PZ101, and BB3SW100, no detections have occurred above cleanup levels over one or two events; sampling of these wells will continue on a quarterly basis until sufficient data have been collected. At BB3GW100, no TPH detections have occurred and metals have not been detected above cleanup levels. Per the RAP, monitoring at BB3GW100 could be reduced to a semi-annual basis, however, quarterly sampling of this well will continue for evaluation of upgradient conditions.

Landfill 10	LF10GW01	Q	Modified	Hand	1		Q1					Q1 (23)			Q1	Q1						Q1						Q	Q	Q	A Focused Feasibility Study (FFS) for Landfills 8 and 10 has been prepared. The Trust is preparing a RAP for the two landfill sites, which is anticipated to be distributed to stakeholders in 2007. LF10GW02 and LF10SP01 could not be sampled during Q1 or Q2 2006 due to thick vegetation. Samples will be collected at these locations during Q3 2006 if the brush can be cleared. TPH analyses have been increased from an annual to quarterly basis in all Landfill 10 wells and seep due to recent detections in groundwater at Landfill 10. The TPH data will be evaluated in the RAP. -LF10GW02 and LF10SP01 could not be sampled during Q2 2006 due to continued obstruction by thick vegetation.

Landfill 10	LF10SP01	Q	Surface	Hand	2		Q3*					Q3* (23)	Q3* (23)		Q3*	Q3*						Q3*					Q	Q	Q			

Notes

1 - Normal, Low Flow, Modified, and Surface water sampling techniques. A description of sampling techniques can be found in the *Field Sampling Plan, Presidio Groundwater Monitoring Project* (Treadwell & Rollo, 2001a).

2 - Truck - Well accessible by truck
LIV - Low Impact Vehicle - Well accessible by LIV or hand truck only
Hand - Well accessible by hand truck only

3 - Sampling Order: At each site sample the wells with the lowest number first. For example, sample the number 1 wells first, the number 2 wells second etc. The following key explains the numbering system.

1 - Wells without significant detections of chemicals of concern
2 - Wells with occasional detections of low concentrations chemicals of concern
3 - Wells with consistent or recent detections of low concentrations chemicals of concern
4 - Wells with high concentrations of chemicals of concern
5 - Wells with very high concentrations of chemicals of concern. Potential for free phase product.

4 - Dissolved gases include methane, ethane, and ethene.

5 - Beginning with Second Quarter 2003, variance was granted from QAPP specified reporting limit requirements for seven metals.

6 - The table has been reformatted to one dissolved metals column. The number of dissolved metals proposed for analysis are denoted by parentheses. For example, Q (23) indicates the 23 metals list should be analyzed on a quarterly basis. The metals associated with each metals list are detailed below.

23 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Ag, Na, Se, Tl, V, and Zn.

22 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Ni, K, Ag, Na, Se, Tl, V, and Zn.

15 Metals List - Al, Sb, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.

14 Metals List - Al, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.

9 Metals List - As, Cr, Cd, Cu, Fe, Mn, Pb, Ni and Zn.

8 Metals List - As, Cr, Cd, Cu, Fe, Pb, Ni and Zn.

7 Metals List - As, Cr, Cd, Cu, Pb, Ni and Zn.

3 Metals List - Al, Fe, and Cr.

7 - Dissolved Oxygen (DO) concentration will be included in field sampling logs. DO values should be recorded immediately before sample collection.

8 - Oxidation-Reduction Potential (ORP) is measured within all wells proposed to be sampled using the low flow method using a flow through cell. For specified wells identified to be sampled by either the normal or modified methods and proposed for ORP measurements, ORP will be measured using a down-hole meter.

9 - Total sulfides are analyzed by the laboratory for all samples collected at the Presidio.

10 - Stoddard Solvent is a specialized formulation of gasoline. Laboratory quantification for Stoddard Solvent is achieved by comparing the shape of the analytical chromatogram within the same carbon range as TPHg for a diagnostic combination of spikes. Since TPHg is also proposed for analysis in this well, the comparison between this well and other sites which may be or have been evaluated for Stoddard Solvent will be maintained. Stoddard Solvent has been specified for this well per MACTEC request. MACTEC will evaluate the Stoddard Solvent data as part of their Building 1047 investigation.

Bold red text indicates proposed changes for the Third Quarter 2006.

All surface seeps where metals analysis is proposed will have two samples collected; one will be filtered and analyzed for dissolved metals and another one will not be filtered and analyzed for total metals.

EM - Elevation Monitoring only

Surface - Surface Water Sampling per Standard Operating Procedure

Trust - the Presidio Trust will evaluate seep BB3SP01 for flow on a quarterly basis and will inform the sampling crew if a sample can be collected.

Q1, Q3, etc. - Sample during specified quarters only

Q - Sample during all quarters unless otherwise directed

Q3* - Annual sampling has been moved to the Third Quarter because samples could not be collected during Q2 2006. Samples will be collected during Q3 2006, if possible.

TPHg, TPHd, TPHf, TPHs: Total Petroleum Hydrocarbons as gasoline, diesel, fuel oil, and stoddard solvent - EPA 3630A: Silica Gel Cleanup Step

General Chemistry Parameters; Alkalinity (total), bicarbonate, carbonate, chloride, fluoride, nitrate+nitrite (as N), sulfate

NDMA - N-nitrosodimethylamine

TBD - To Be Determined

TPH, PAHs, VOCs, PCBs, chlorinated herbicides, general chemistry parameters, TDS, and dissolved metals have met their post-remediation groundwater monitoring requirements and cleanup levels from the Fill Site 5 RAP for the required frequency of monitoring within 1349MW03R, 1349MW101, and 1349MW102 and were approved for removal prior to the Second Quarter 2006. It is noted that these three wells will be monitored per requirements of the Building 1349 Area CAP, once it is finalized and implemented.

Comm / PX	600GW101	Q	Low-Flow	Truck	3		Q					Q (+14)			Q	Q	Q				Q			Q			Q	Q	Q		PAH and VOC analyses within 600GW108 will be conducted annually in the First Quarter, along with other site wells, because PAHs have never been detected and no significant detections have been reported in the last four sampling events within 600GW108. The Final CAP for the Comm/PX Area was submitted to the regulatory agencies for review in December 2005. Groundwater sampling will continue to be conducted at the Commissary/PX Area as shown until the CAP is currently being implemented. Sampling will not be conducted while the CAP is being implemented. Sampling will resume, in accordance with the CAP, once the implementation is complete (sampling is expected to resume First Quarter 2007). ORP is measured for the evaluation of redox conditions, in accordance with recommendations from the Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites.

Landfill 10	LF10GW01	Q	Modified	Hand	1		Q1					Q1 (23)			Q1	Q1					Q1							Q	Q	Q		A Focused Feasibility Study (FFS) for Landfills 8 and 10 has been prepared. The Trust is preparing a RAP for the two landfill sites, which is anticipated to be distributed to stakeholders in 2007. LF10GW02 and LF10SP01 could not be sampled during Q1, Q2, or Q3 2006 due to thick vegetation. The brush has been cleared and samples will be collected at these locations during Q4 2006 if the brush can be cleared. TPH analyses have been increased from annual to quarterly in all Landfill 10 wells and seep due to recent detections in groundwater at Landfill 10. The TPH data will be evaluated in the RAP. LF10GW02 and LF10SP01 could not be sampled during Q2 2006 due to continued obstruction by thick vegetation.

Notes

1 - Normal, Low Flow, Modified, and Surface water sampling techniques. A description of sampling techniques can be found in the *Field Sampling Plan, Presidio Groundwater Monitoring Project* (Treadwell & Rollo, 2001a).

2 - Truck - Well accessible by truck
LIV - Low Impact Vehicle - Well accessible by LIV or hand truck only
Hand - Well accessible by hand truck only

3 - Sampling Order: At each site sample the wells with the lowest number first. For example, sample the number 1 wells first, the number 2 wells second etc. The following key explains the numbering system.

1 - Wells without significant detections of chemicals of concern
2 - Wells with occasional detections of low concentrations chemicals of concern
3 - Wells with consistent or recent detections of low concentrations chemicals of concern
4 - Wells with high concentrations of chemicals of concern
5 - Wells with very high concentrations of chemicals of concern. Potential for free phase product.

4 - Dissolved gases include methane, ethane, and ethene.

5 - Beginning with Second Quarter 2003, variance was granted from QAPP specified reporting limit requirements for seven metals.

6 - The table has been reformatted to one dissolved metals column. The number of dissolved metals proposed for analysis are denoted by parentheses. For example, Q (23) indicates the 23 metals list should be analyzed on a quarterly basis. The metals associated with each metals list are detailed below.

23 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Ag, Na, Se, Ti, V, and Zn.
22 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Ni, K, Ag, Na, Se, Ti, V, and Zn.
15 Metals List - Al, Sb, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
14 Metals List - Al, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
9 Metals List - As, Cr, Cd, Cu, Fe, Mn, Pb, Ni and Zn.
8 Metals List - As, Cr, Cd, Cu, Fe, Pb, Ni and Zn.
7 Metals List - As, Cr, Cd, Cu, Pb, Ni and Zn.
3 Metals List - Al, Fe, and Cr.

7 - Dissolved Oxygen (DO) concentration will be included in field sampling logs. DO values should be recorded immediately before sample collection.

8 - Oxidation-Reduction Potential (ORP) is measured within all wells proposed to be sampled using the low flow method using a flow through cell. For specified wells identified to be sampled by either the normal or modified methods and proposed for ORP measurements, ORP will be measured using a down-hole meter.

9 - Total sulfides are analyzed by the laboratory for all samples collected at the Presidio.

10 - Stoddard Solvent is a specialized formulation of gasoline. Laboratory quantification for Stoddard Solvent is achieved by comparing the shape of the analytical chromatogram within the same carbon range as TPHg for a diagnostic combination of spikes. Since TPHg is also proposed for analysis in this well, the comparison between this well and other sites which may be or have been evaluated for Stoddard Solvent will be maintained. Stoddard Solvent has been specified for this well per the Trust's request. The Trust will evaluate the Stoddard Solvent data as part of their Building 1047 investigation.

Bold red text indicates proposed changes for the Fourth Quarter 2006.

All surface seeps where metals analysis is proposed will have two samples collected; one will be filtered and analyzed for dissolved metals and another one will not be filtered and analyzed for total metals.

EM - Elevation Monitoring only

Surface - Surface Water Sampling per Standard Operating Procedure

Trust - the Presidio Trust will evaluate seep BB3SP01 for flow on a quarterly basis and will inform the sampling crew if a sample can be collected.

Q1, Q3, etc. - Sample during specified quarters only

Q - Sample during all quarters unless otherwise directed

Q4* - Annual sampling has been moved to the Fourth Quarter because samples could not be collected during Q3 2006 due to heavy vegetation.

TPHg, TPHd, TPHfo, TPHss: Total Petroleum Hydrocarbons as gasoline, diesel, fuel oil, and stoddard solvent - EPA 3630A: Silica Gel Cleanup Step

General Chemistry Parameters; Alkalinity (total), bicarbonate, carbonate, chloride, fluoride, nitrate+nitrite (as N), sulfate

NDMA - N-nitrosodimethylamine

TBD - To Be Determined

Notes:

- 1 - Depth to water reading was measured from the northernmost side of the casing.
The elevation presented is the average of three measurements.
- 2 - Elevations reported in Presidio Lower Low Water (PLLW) datum.
- 3 - Top of casing elevation is approximate due to damaged casing.
- 4 - Surface water sample, no groundwater elevation.
- 5 - Unable to locate monitoring well / piezometer on 14 August 2006.
- 6 - Value represents the bottom of casing elevation in PLLW.
- 7 - Well 600GW101 was destroyed in July 2006.
- 8 - Groundwater level was above the top of casing.
- 9 - The lid of monitoring well LF10GW100 has been surveyed by the Trust (175.60 feet PLLW). The elevation difference between the monitoring well lid and the top of casing was measured in the field and has been verified to be 0.30 feet. Therefore, the LF10GW100 top of casing elevation is approximately 175.30 feet PLLW.
- 10 - LF10GW02 and LF10SP01 were inaccessible due to overgrown vegetation.
- 11 - Piezometer used to monitor surface water seep location.

Table 2A
Groundwater Elevation Summary for Presidio Monitoring Wells
Elevations Collected on 14 August 2006
Presidio of San Francisco, California

Site	Well ID	Time	Average Depth to Water ¹ (feet)	Top of Casing Elevation ² (feet PLLW)	Groundwater Elevation ² (feet PLLW)	Well Type	Water Level Frequency
------	---------	------	---	--	--	--------------	-----------------------------

12 - BB3PZ101 was formerly named BB3SW103. Additionally, the depth to water measurement (14.45 feet) during the Fourth Quarter 2004 was measured from the ground surface. Subsequently, the ground and the top of casing elevations were surveyed and the depth to water measurement was converted to a top of casing measurement (16.80 feet).

13 - Predicted tidal schedules were taken from:

http://tidesandcurrents.noaa.gov/get_predictions.shtml?year=2006&stn=1813+San+Francisco

14 - Actual high and low tidal schedules and magnitudes were taken from:

http://co-ops.nos.noaa.gov/data_res.html by selecting 'U.S. and Global Coastal Stations' then selecting station number '9414290 San Francisco, CA'. Water level magnitudes were taken by selecting the 'W3 - High/Lows' Time Interval and converting the data into the PLLW datum.

Predicted Tidal Schedule on 14 August 2006 ¹⁰:

Low Tide - 4:20 AM (Magnitude 0.7 feet PLLW)

High Tide - 10:55 PM (Magnitude 6.3 feet PLLW)

Observed Tidal Schedule and Magnitude on 14 August 2006 ¹¹:

Low Tide - 4:42 AM (Magnitude 0.79 feet PLLW)

High Tide - 11:18 PM (Magnitude 6.26 feet PLLW)

Footnotes

1 - BB3PZ101 was formerly named BB3SW103

2 - Note BBDA 3 fixed monitoring points

3 - Piezometer construction details for 1065PZ5AR are based on narrative description, last paragraph of Section 4.6, *Interim Data Report, Building 1065 Area, Presidio of San Francisco, California*, February 19, 2003, by MACTEC.

4 - Well construction details for OW-1 are from a .pdf boring log (10-14-2003 E:\Backups\OW-1.bor) provided by the Trust via email on 14 October 2003.

5 - OW-1 total depth was reported as 29.12 feet in a .pdf boring log (10-14-2003 E:\Backups\OW-1.bor) provided by the Trust via email on 14 October 2003. Based on screen interval, this value was assumed to be in error and was increased to 30.12.

6 - All well construction details for the Doyle Drive wells were measured from boring logs and converted from metric units as reported in Attachment A to the *Request for Authorization to Perform a Aquifer Testing near Building 230 at the Presidio, San Francisco*, by Baseline Environmental Consulting, 1 April 2002. Boring logs do not indicate sand trap or presence of end caps. Therefore, the bottom of casing is the same as the bottom of the screened interval.

7 - Borehole diameter was not reported for Doyle Drive wells on boring logs included as Attachment B to the *Request for Authorization to Perform a Aquifer Testing near Building 230 at the Presidio, San Francisco*, by Baseline Environmental Consulting, 1 April 2002. Boring method described as "rotary wash" without reference to boring diameter in the *Data Report, Piezometer Installation and Development, Doyle Drive Reconstruction Project, San Francisco*, by Baseline Environmental Consulting, 11 April 2001.

NR - Not reported

PLLW - Presidio Lower Low Water datum

TBD - To be determined

Note

See Groundwater Sampling Standard Operating Procedure No. 002 in the *Field Sampling Plan, Presidio Groundwater Monitoring Project* (Treadwell & Rollo, 2001a) for complete equations for calculating borehole volumes.

Table 5
Analytical Plan Summary
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

Analyte	Laboratory Method	Container Type and Volume ¹	Preservative ²	Holding Time ¹
TPH as gasoline (carbon range C7-C12)	Modified EPA 8015B	3 x 40 mL VOAs	HCl	14 Days
TPH as Stoddard Solvent (carbon range C7-C12)	Modified EPA 8015B	3 x 40 mL VOAs (C&T) 2 x 1L Amber (CAS)	HCl	14 Days
TPH as diesel ³ (carbon range C12-C24)	Modified EPA 8015B	1 x 1L Amber 2 x 1L Amber (CAS)	-	14 Days Extract
TPH as fuel oil ³ (carbon range C24-C36)	Modified EPA 8015B	1 x 1L Amber 2 x 1L Amber (CAS)	-	14 Days Extract
VOCs	EPA 8260B	3 x 40 mL VOAs	HCl	14 Days
VOCs (TCE only)	EPA 8260B	3 x 40 mL VOAs	HCl	14 Days
BTEX	EPA 8021B	2 x 40 mL VOAs	HCl	14 Days
PAHs	EPA 8310	2 x 1L Ambers	-	7 Days Extract
SVOCs	EPA 8270C	2 x 1L Ambers	-	7 Days Extract
OCP / PCBs	EPA 8081/8082	2 x 1L Ambers	-	7 Days Extract
Chlorinated Herbicides	EPA 8151A	2 x 1L Ambers	-	7 Days Extract
Arsenic (III and V) Speciation	EPA 1632 Mod	1 x 250 mL Plastic	HCl	28 Days
Mercury	EPA 7470	1 x 500 mL Plastic	HNO3	28 Days
Dissolved Metals (ICP) ⁴	EPA 6010	1 x 500 mL Plastic	HNO3	6 Months
Dissolved Metals (ICP/MS) ⁴	EPA 6020	1 x 500 mL Plastic	HNO3	6 Months
Dissolved Gases	RSK 175	3 x 40 mL VOAs	HCl	14 Days
Hexavalent Chromium	EPA 7196A	1 x 250 mL Plastic	-	24 Hours
Dissolved Lead ⁴	EPA 7470	1 x 500 mL Plastic	HNO3	28 Days
Cyanide	EPA 335.2	1 x 1L Plastic	NaOH	14 Days
Sulfide	EPA 376.2	1 x 1L Plastic	NaOH+ZnOAc	7 Days
TDS ⁵	EPA 160.1	1 x 1L Plastic	-	7 Days
TOC	EPA 415.2	3 x 40 mL VOAs	H ₂ SO ₄	28 Days
TSS ⁵	EPA 160.2	1 x 1L Plastic	-	7 Days
Perchlorate	EPA 314.0	1 x 250 mL Plastic	-	28 Days
NDMA	EPA 1625	2 x 1L Ambers	-	7 Days Extract
1,4-dioxane	EPA 8270C	2 x 1L Ambers	-	7 Days Extract
PBDE	EPA 1614	3 x 1L Ambers	-	7 Days Extract
General Chemistry				
Alkalinity ⁵	EPA 310.1	1 x 1L Plastic	-	28 Days
Bicarbonate ⁵	EPA 310.1	1 x 1L Plastic	-	28 Days
Carbonate ⁵	EPA 310.1	1 x 1L Plastic	-	28 Days
Chloride ⁵	EPA 300.0	1 x 1L Plastic	-	28 Days
Fluoride ⁵	EPA 300.0	1 x 1L Plastic	-	28 Days
Nitrate as Nitrogen / Nitrite as Nitrogen ⁵	EPA 300.0	1 x 1L Plastic	-	48 Hours
Nitrate as Nitrogen/ Nitrite as Nitrogen	EPA 353.2	1 x 125 mL Plastic	H ₂ SO ₄	28 Days
Sulfate ⁵	EPA 300.0	1 x 1L Plastic	-	28 Days

Notes

1 - Minimum sample volumes and holding times as specified by the project laboratory Curtis and Tompkins.

2 - All samples will be placed on ice and kept at an EPA prescribed temperature of 4 degrees Celsius.

3 - This analysis includes silica gel cleanup.

4 - Field filtration to be performed in the field using a 0.45 micron filter.

5 - All of these analyses can be taken from the same 1L plastic container.

Acronyms

BTEX - Benzene, Toluene, Ethylbenzene, and Xylenes

ICP - Inductively Coupled Plasma

ICP/MS - Inductively Coupled Plasma with

Mass Spectrography confirmation

NDMA - N-nitrosodimethylamine

OCPs - Organochlorine Pesticides

PAHs - Polycyclic Aromatic Hydrocarbons

PBDE - Polybrominated diphenyl ether

PCBs - Polychlorinated Biphenyls

SVOCs - Semi-Volatile Organic Compounds

TCE - Trichloroethene

TDS - Total Dissolved Solids

TOC - Total Organic Carbon

TPH - Total Petroleum Hydrocarbons

TSS - Total Suspended Solids

VOCs - Volatile Organic Compounds

- = No preservative

Notes

Edits shown in **bold** text were made on 1 April 2003 based on updated version of Table 7-6 of the QAPP, transmitted from Chris Nelson on 14 March 2003.

1 Water Quality Criteria is from Table 7-6 of the Cleanup Levels Document (EKI, 2002).

2 These are limits established in the QAPP (Tetra Tech, 2001).

- = not established

(a) Cleanup levels are based upon concentrations of COPCs that result in chronic toxicity to aquatic organisms, or to humans through consumption of water and fish, whichever is more stringent. Cleanup levels apply to surface water and groundwater that may exfiltrate directly to surface water, such as Lobos Creek, Mountain Lake, and the Tennessee Hollow Riparian Corridor upon enhancement.

Table 6
Water Quality Criteria and Analytical Reporting Limits
Presidio Groundwater Monitoring Program
Presidio of San Francisco, California

Notes (continued)

- (b) Cleanup levels are based upon concentrations of COPCs that result in chronic toxicity to aquatic organisms. Cleanup levels apply to seeps and to groundwater that emerges as freshwater seeps.
- (c) Cleanup levels are based upon concentrations of COCs that result in chronic toxicity to marine organisms. Cleanup levels apply to marine or salt water environments.
- (d) Cleanup level listed is a promulgated or proposed federal Maximum Contaminant Level (MCL), or promulgated or proposed MCL or action level specific to the State of California. MCLs obtained from U.S. EPA Region IX, *Drinking Water Standards and Health Advisories Tables*, dated February 2000. Drinking water cleanup levels apply to groundwater and surface water at the Presidio.
- (e) Cleanup level obtained from Title 40 of the Code of Federal Regulations, Part §131.38, *Establishment of Numerical Criteria for Priority Toxic Pollutants for the State of California*, or *California Toxics Rule (CTR)*, promulgated 18 May 2000.
- (f) Hyphen indicates that a cleanup level is not specified in Presidio Trust QAPP.
- (g) Cleanup level obtained from California Environmental Protection Agency, Regional Water Quality Control Board, San Francisco Bay Region, *Water Quality Control Plan, San Francisco Bay Basin. San Francisco Bay Region* ("Basin Plan"), dated 21 June 1995.
- (h) Cleanup level is a function of hardness. Value shown is based on a hardness of 100 mg/L as calcium carbonate.
- (i) Cleanup level is expressed as a function of the water-effects ratio, as defined in the CTR.
- (j) Cleanup level listed is a secondary MCL. Secondary MCLs apply to chemicals in drinking water that adversely affect its odor, taste, or appearance and therefore cause people to discontinue using the water.
- (k) MCL based upon treatment technique. Treatment technique and public notification required at action level of 15 µg/L for lead.
- (l) Cleanup level for mercury is 0.012 µg/L. However, this level is below the typical analytical method reporting limit of 0.025 µg/L. A cleanup objective of 0.012 µg/L is desirable, but attainment can only be determined at the analytical method reporting limit.
- (m) Cleanup level for COC in total recoverable form.
- (n) Cleanup level for COC corresponds to instantaneous maximum value.
- (o) Cleanup level obtained from Montgomery Watson, *Fuel Product Action Level Development Report, Presidio of San Francisco, California* ("FPALDR").

Table 6
Water Quality Criteria and Analytical Reporting Limits
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

Notes (continued)

- (p) This level is below the typical analytical method reporting limit range of 0.1 to 10 µg/L for semivolatile organic compounds. Cleanup level listed is desirable, but attainment can only be determined at the analytical method reporting limit. Cleanup level is established at the typical analytical method reporting limit range for semivolatile organic compounds assuming no matrix interference. In the event of matrix interference, actual method reporting limits determining compliance with cleanup levels may be raised.
- (q) Cleanup level obtained from Montgomery Watson, *Development of Point of Compliance Concentrations (POCCs) for Gasoline in Surface Waters and Sediments of the Proposed Freshwater Stream, Presidio of San Francisco, California*, dated 4 May 1999. Numerical values based upon bioassay studies performed by RWQCB and review of toxicological data published in scientific literature.
- (r) Cleanup level applies to total PCBs.
- (s) Cleanup level is State of California action level for drinking water.
- (t) This level is below the typical analytical method reporting limit range of 0.05 to 0.5 µg/L for PCBs and pesticides. Cleanup level listed is desirable, but attainment can only be determined at the analytical method reporting limit.

Notes

- 1 - The table has been reformatted to one dissolved metals column. The number of dissolved metals proposed for analysis are denoted by parentheses. For example, Q (23) indicates the 23 metals list should be analyzed on a quarterly basis. The metals associated with each metals list are detailed below.
- 23 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Ag, Na, Se, Th, V, and Zn.
- 22 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Ni, K, Ag, Na, Se, Th, V, and Zn.
- 15 Metals List - Al, Sb, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
- 14 Metals List - Al, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
- 9 Metals List - As, Cr, Cd, Cu, Fe, Mn, Pb, Ni and Zn.
- 8 Metals List - As, Cr, Cd, Cu, Fe, Pb, Ni and Zn.
- 7 Metals List - As, Cr, Cd, Cu, Pb, Ni and Zn.
- 3 Metals List - Al, Fe, and Cr.
- 2 - TPH-G, TPH-D, TPH-FO: Total Petroleum Hydrocarbons as gasoline, diesel and fuel oil - EPA 3630A: Silica Gel Cleanup Step
- 3 - Commissary/PX Area samples will be analyzed for dissolved sulfide rather than total sulfide.
- 4 - If DAESP03 is dry do not replace this duplicate sample with another.

Bold indicates samples that are duplicated at both the project and QC laboratories.

Notes

1 - Metals include aluminum, arsenic, arsenite, arsenate, antimony, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, sodium, silver, selenium, thallium, vanadium, and zinc.

2 - TPH as fuel oil uses a motor oil standard for carbon range (C₂₄-C₃₆).

3 - Sample collected from source water tank on a field vehicle.

4 - Sample collected from the deionization system outlet at Blaine Tech Services, Inc. facility in San Jose, CA.

Table 11 identifies current and historical data qualifiers.

TDS - total dissolved solids

NA - Not analyzed

ND - Not detected above the laboratory reporting limit

OCPs - organochlorine pesticides

PAHs - polycyclic aromatic hydrocarbons

PCBs - polychlorinated biphenyls

SVOCs - semi-volatile organic compounds

TPH - total petroleum hydrocarbons

VOCs - volatile organic compounds

µg/L - micrograms per liter

mg/L - milligrams per liter

Table 11
Laboratory Qualifiers for Current and Historical Analytical Data
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

The following data validation qualifiers were used for analytical data generated beginning in the Second Quarter 2001. Multiple data qualifiers can be applied to individual sample results. These qualifiers are recommended in the October 1999 document titled *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*:

#	The continuing calibration verification (CCV) drifted outside the limits although the average CCV drift was within the limits per method requirements.
U	The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample, refer to the specific analytical report for the rationale behind the qualification.
J+	The analyte was positively identified; the associated numerical value is biased high due to a high surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
J-	The analyte was positively identified; the associated numerical value is biased low due to a low surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
Jb	The analyte was identified below the laboratory reporting limit but above the laboratory method detection limit and QAPP-specified reporting limit.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

The current reported analytical data also includes the following laboratory supplied validation comments:

A-01	No H ₂ SO ₄ preserved sample available for 28 day hold time.
B	Analyte is found in the associated blank as well as in the sample.
C	Presence confirmed, but confirmation concentration differed by more than a factor of two.
g	Compound was found in the blank and sample.
H	Heavier hydrocarbons contributed to the quantitation.
HT-04	This sample was analyzed beyond the EPA recommended holding time. The results may still be useful for their intended purpose.

Table 11
Laboratory Qualifiers for Current and Historical Analytical Data
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

HT-RA	This sample was originally analyzed within the EPA recommended hold time. Re-analysis for confirmation or dilution was performed past the recommended hold time. The results may still be used for their intended purpose.
ndp	Hydrocarbon reported does not match the pattern of the diesel standard.
L	Lighter hydrocarbons contributed to the quantitation.
QB01	The method blank contains this analyte at a concentration above the reporting limit; however, the concentration is less than 5% of the sample result, which is negligible according to method criteria.
Y	Sample exhibits a fuel pattern, which does not resemble standard.
Z	Sample exhibits unknown single peak or peaks.

Analytical data reported prior to the second quarter of 2001 have used the same data qualifiers described above, but have also used the validation qualifiers and comments Q, Rd, DR, D, B, G, P, d, j, k, z. Descriptions of these previously used validation qualifiers and comments are provided in the quarterly monitoring report corresponding to the sampling date shown in the analytical summary tables.

The following is a table of data validation qualifiers and comments used by Montgomery Watson for their previous Presidio groundwater monitoring work.

Data Validation Qualifiers:

J – Qualified as estimated

U – Qualified as not detected

R – Qualified as rejected

Data Validation Comments:

1. Qualified due to detected concentration in associated method blank sample.
2. Qualified due to detected concentration in associated trip blank sample.
3. Qualified due to detected concentration in associated filter blank sample.
4. Qualified due to detected concentration in associated equipment rinsate blank sample.
5. Qualified as positively biased due to surrogate recoveries above the established acceptance limits.
6. Qualified as negatively biased due to surrogate recoveries below the established acceptance limits.
7. Qualified due to surrogate recoveries outside the established acceptance limits; bias cannot be determined.
8. Qualified as positively biased due to MS/MSD recoveries above the established acceptance limits.
9. Qualified as negatively biased due to MS/MSD recoveries below the established acceptance limits.
10. Qualified due to MS/MSD recoveries outside the established acceptance limits; bias cannot be determined.
11. Qualified as positively biased due to LCS recoveries above the established acceptance limits.
12. Qualified as negatively biased due to LCS recoveries below the established acceptance limits.
13. Qualified due to LCS recoveries outside the established acceptance limits; bias cannot be determined.
14. Qualified as positively biased due to calibration nonconformances.

Table 11
Laboratory Qualifiers for Current and Historical Analytical Data
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

15. Qualified as negatively biased due to calibration nonconformances.
16. Qualified due to calibration nonconformances; bias cannot be determined.
17. Qualified as negatively biased due to holding time nonconformances.
18. Qualified as negatively biased due to sample receipt nonconformances.
19. Qualified as positively biased due to sample receipt nonconformances.
20. Qualified due to sample receipt nonconformances; bias cannot be determined.
21. Qualified as positively biased due to other criteria.
22. Qualified as negatively biased due to other criteria.
23. Qualified due to other criteria; bias cannot be determined.
24. Qualified due to detected concentration in associated source water sample.
25. Qualified due to chromatographic pattern of the sample does not match the calibration pattern.
26. Reported value determined by method of standard addition; bias cannot be determined.
27. Qualified as negatively biased due to post-digest spike recovery between 40% and 85%.
28. Estimated value; result is detected between the method detection limit (MDL) and the reporting limit.
29. Qualified due to holding times exceeded.
30. Qualified as estimated; compound is a common laboratory contaminant.
31. Reported value determined by GC/MS library search; compound is tentatively identified and quantitation is estimated.
32. Qualified data explained further in the report associated with the sampling event.
33. Qualified to field duplicate RPD outside of established limits; bias cannot be determined.
34. Final purge readings are not representative of site conditions. The reported readings are taken from earlier entries associated with that purge log.
35. Questionable field parameter results; readings do not appear to be representative of site conditions.

APPENDIX A
Sampling Area Summaries

**BUILDING 900s AREA
APPENDIX SECTION A-1
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California**

1.0 INTRODUCTION AND BACKGROUND

The Building 900s Area is located in the northern portion of the Presidio, adjacent to Crissy Field at the boundary of the San Francisco Bay, just southeast of the Golden Gate Bridge (Figure 1). The site is approximately 15 acres with surface elevations ranging from approximately 10 to 15 feet above the Presidio lower low water (PLLW) datum (Montgomery Watson, 1996b).

Buildings in the Building 900s Area were associated with aviation maintenance activities for Crissy Field, which was built in 1919, and a formerly active Coast Guard Station (Figure A-1-1). Building uses shifted from airfield maintenance to vehicle maintenance in 1936. Building uses of concern include: a former motor pool repair shop, transformer storage, a solvent dip tank, bulk oil and waste oil storage, automotive bodywork, painting, battery storage, a former fuel pump house, fuel storage, steam cleaning, an underground oil-water separator, aircraft maintenance, a boiler house, equipment storage, vehicle maintenance, waste oil/solvent storage, a fueling area, and mine storage (Montgomery Watson, 1997a). Documented potential sources of environmental concern are surface spills associated with vehicle maintenance and waste oil storage and subsurface releases from underground storage tanks (USTs) and associated piping (Dames & Moore, 1997).

Groundwater samples collected from site wells have previously been analyzed for total petroleum hydrocarbons (TPH) as gasoline (TPHg), TPH as diesel (TPHd), TPH as fuel oil (TPHfo), volatile organic compounds (VOCs), and dissolved metals. Dissolved metals analysis has not been a part of the Building 900s Area monitoring program since 1997. Summaries of dissolved oxygen, TPH, and VOC results can be found in Tables A-1-1 through A-1-3.

The Coast Guard Station is located adjacent to and southeast of the site and has three associated monitoring wells, CGGW01, CGGW02, and CGGW03 (Figure A-1-1). The Coast Guard station is no longer included in the Presidio-wide Groundwater Monitoring Program. Prior groundwater sampling of these wells did not detect any concentrations of TPHg, TPHd, TPHfo or metals above laboratory detection limits and sampling was subsequently discontinued in 1996. Coast Guard Station groundwater analytical results for TPH and lead are summarized in Table A-17-1 in Appendix A of the *Draft Presidio Quarterly Groundwater Monitoring Annual Summary Report, Fourth Quarter 2001* (Treadwell & Rollo, 2002c).

A reduction in sampling frequency for all Building 900s Area wells to annual was previously approved by the stakeholders and sampling was only conducted at the site once in 2006, during the First Quarter.

2.0 SITE DESCRIPTION AND GEOLOGY

Unconsolidated deposits encountered during previous site investigations in the Building 900s Area include three units: fill material, estuarine sand deposits with local interbedded fine-grained estuarine deposits, and Franciscan Complex bedrock.

Prior to remediation activities, the Building 900s Area consisted mostly of artificial fill with isolated areas of debris fill. The artificial fill was a mixture of sand, silt, and clay composed primarily of dredged sand from San Francisco Bay (used to fill historic wetlands beneath Crissy Field) and serpentinite and/or chert gravel used as road base. The debris fill was composed of silt and sand mixed with construction debris, including concrete, wood, glass, brick fragments, and wire (Dames & Moore, 1997). Fill materials range in thickness from 1.5 to 7 feet.

The fill materials are underlain by native estuarine sands interbedded with fine-grained estuarine deposits. The sand thickness extends up to approximately 50 feet, and the interbedded, fine-grained sediments range in thickness from 1 inch to 2.5 feet. Shell fragments and layers of organic material (including peat) up to 0.9 feet thick are locally present. At the location of former well 937GW01, adjacent to the serpentinite cliff that borders the site to the west and southwest, silty clay with sand and gravel (weathered serpentinite) extends to at least 35 feet below ground surface (bgs).

The laterally continuous, shallow, fine-grained estuarine deposits (also known as Bay Mud), which separate shallow water-bearing sand units to the southeast in the Building 637 Area (described in Appendix A, of the *Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2004*, Treadwell & Rollo, 2004c), are not present beneath the Building 900s Area. Interbedded, fine-grained sediments are discontinuous and mostly occur locally north of Building 937.

The estuarine sediments are underlain by Franciscan Complex bedrock, predominantly serpentinite. The massive serpentinite outcrop exposed along the western portion of the Building 900s Area forms a cliff approximately 60 feet above ground surface (Figure A-1-1). At the base of the cliff, the serpentinite bedrock dips below ground surface and the depth to bedrock generally increases from the cliff to San Francisco Bay, with the maximum encountered depth at approximately 50 feet bgs.

A single, heterogeneous, unconfined (water table) coastal aquifer is present beneath the Building 900s Area. The water table beneath the Building 900s Area has, in the past, typically ranged from 6 to 9 feet bgs. The thickness of the aquifer increases as the depth to bedrock increases from the serpentinite cliff on the west side of the site toward San Francisco Bay (Figure A-1-1).

The Building 900s Area monitoring wells are generally screened in estuarine sand deposits of the aquifer, with some wells screened partially in fine-grained lenses or in weathered serpentinite bedrock. Because the site wells are screened in a single water table aquifer without discrete water-bearing zones, the wells are separated into three groups based on relative screened elevation rather than water-bearing zones. These screened intervals are referred to as the shallow, intermediate, and deep.

Groundwater in the Crissy Field Groundwater Area (Figure 1) generally flows north to northeast toward San Francisco Bay, with locally divergent flow directions (Montgomery Watson, 1999a). In the northwestern portion of the Building 900s Area, the historical coastal features influence the hydrogeology in the shallow interval by diverting groundwater flow (and contaminant migration) northwest and north along the historic lagoonal water channel (Montgomery Watson, 1997b), rather than northeast directly toward the bay. All three intervals have similar groundwater elevations.

3.0 REMEDIAL ACTION PLAN

In April 1998, the Department of Toxic Substances Control (DTSC) approved the Crissy Field Remedial Action Plan (RAP). The Crissy Field RAP addressed multiple Crissy Field area contamination sites, including the Building 900s Area. For the Building 900s Area, the Crissy Field RAP selected source soil removal and subsequent confirmation groundwater monitoring to ensure that contaminant concentrations do not exceed applicable standards. Approximately 39,000 tons of contaminated soil and fill were excavated and removed (Army and DTSC, 1998). The Crissy Field RAP requires that groundwater monitoring be conducted for a minimum of five years following construction completion, and that, should contamination concentrations exceed applicable standards for two consecutive quarters, the data be reviewed with the stakeholders and an action plan developed and implemented to address the groundwater contamination. Seventeen additional monitoring wells were installed between 19 and 29 June 2001 to expand the monitoring well network for this area (Figure A-1-1). The Crissy Field RAP identifies the following groundwater cleanup levels for this area:

Cis-1,2-dichloroethene (cis-1,2-DCE)	140,000 micrograms per Liter (µg/L)
Trans-1,2 dichloroethene (trans-1,2-DCE)	140,000 µg/L
Trichloroethene (TCE)	81 µg/L
Vinyl chloride	525 µg/L

In addition, five-year reviews of groundwater use in this area are required to ensure that no human use is occurring without appropriate treatment. These reviews are to continue until the groundwater meets drinking water standards or is no longer classified as a “potential drinking water source.” In May 2002, monitoring well 937GW108 was installed at the Building 937 Area as requested by the DTSC, and on 14 May 2002, dry well 979GW111 was replaced with

monitoring well 979GW111R. This completed the monitoring well network required by the Crissy Field RAP.

4.0 GROUNDWATER MONITORING

The Building 900s Area has 28 associated monitoring wells (Figure A-1-1). Work at the site is currently being performed in accordance with the *Crissy Field RAP* and the *Field Sampling Plan* (FSP) (Treadwell & Rollo, 2001a). In accordance with Table 1A, groundwater elevations were collected during the Third Quarter 2006 from all Building 900s Area wells. Groundwater elevations were not proposed for collection during the Fourth Quarter 2006 (Table 1B).

Groundwater sampling was only proposed during the First Quarter 2006 and therefore, no groundwater samples were collected from any of the Building 900s Area wells during either the Third or Fourth Quarters 2006. First Quarter 2006 TCE, DCE, and vinyl chloride results are shown in Figures A-1-5 through A-1-7.

4.1 Groundwater-Level Measurements and Interpretation

Building 900s Area monitoring wells are screened in three different intervals of the single aquifer present. These screened intervals are referred to as shallow, intermediate, and deep zones and are differentiated by relative screen depths. A complete list of site wells, their associated water-bearing zones, and historical groundwater elevations, are presented in Table A-1-4.

Third Quarter 2006 groundwater elevation measurements were manually collected on 14 August 2006. Groundwater elevations at the Building 900s Area were not collected in the Fourth Quarter 2006. The frequency of water level measurements was reduced to an annual basis prior to the Fourth Quarter 2006. The next water level measurements at Buildings 900 Area will be performed in the First Quarter 2007. Water level meters were calibrated on 14 August and calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

4.1.1 Shallow Groundwater

During the Third Quarter 2006, shallow groundwater elevations at the Building 900s Area ranged from 4.18 to 7.85 feet above PLLW in monitoring wells 979GW113 and 937GW12, respectively. The majority of groundwater elevations measured during the Third Quarter 2006 was within the range of historical elevations. The Third Quarter 2006 shallow groundwater flow direction in the northern portion of the Building 900s Area was northerly along the historic lagoonal channel, while the groundwater flow direction in the southern portion of the site was northeasterly towards San Francisco Bay (Figure A-1-2). The average groundwater gradients for

the shallow monitoring wells in the northern and southern portions of the site were estimated to be approximately 0.005 and 0.015 feet per foot, respectively.

4.1.2 Intermediate Groundwater

During the Third Quarter 2006, intermediate groundwater elevations at the Building 900s Area ranged from 3.98 feet above PLLW in monitoring well 979GW114 to 5.49 feet above PLLW in monitoring well 937GW102. The Third Quarter 2006 intermediate groundwater flow direction was north to northeasterly towards San Francisco Bay (Figure A-1-3). The average groundwater gradients for the intermediate monitoring wells in the northern and southern portions of the site were estimated to be approximately 0.004 and 0.009 feet per foot, respectively.

4.1.3 Deep Groundwater

During the Third Quarter 2006, deep groundwater elevations at the Building 900s Area ranged from 2.34 to 6.17 feet above PLLW in monitoring wells 979GW117 and 937GW38, respectively. The deep groundwater flow direction was northerly (Figure A-1-4). The average groundwater gradient for the deep monitoring wells was estimated to be approximately 0.006 feet per foot.

4.1.4 Vertical Gradients

Building 900s Area vertical gradients are presented in Table A-1-5. Vertical groundwater gradients were calculated for three well clusters each having one shallow, intermediate, and deep well: 900WC-1, 900WC-2, and 900WC-3. Well clusters 900WC-1 and 900WC-2 are located northeast of Building 937 (Figure A-1-1). Well cluster 900WC-3 is located in the northern portion of the site. A description of which wells are contained in each well cluster and a description of how the vertical gradients were calculated can be found in Table A-1-5.

During Third Quarter 2006 vertical gradients were estimated as follows:

- A downward (positive) vertical gradient was observed between the intermediate/deep and shallow/deep intervals within well cluster 900WC-3.
- An upward (negative) vertical gradient was observed between the all three intervals within well clusters 900WC-1 and 900WC-2.
- No vertical gradient was observed between the shallow/intermediate intervals within well cluster 900WC-3.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during Third Quarter 2006 are consistent with historical values and interpretations. The groundwater sampling frequency at the Building 900s Area will continue to be annual until the first five-year review, which is scheduled to be completed in 2007.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Final RAP, Crissy Field Area*, Presidio of San Francisco, California (Army, Headquarters, I Corps, and Fort Lewis and California DTSC, 1998).

Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.

µg/L - micrograms per liter

ND - Not Detected

NA - Not analyzed

1,2-DCE - 1,2-Dichloroethene

Cis-1,2-DCE - cis-1,2-Dichloroethene

Trans-1,2-DCE - trans-1,2-Dichloroethene

MTBE - Methyl tert-butyl ether

TCE - Trichloroethene

PCE - Tetrachloroethene

VOC - Volatile organic compound

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

-- - Clean up concentrations not established.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.

H - Heavier hydrocarbons contributed to the quantitation

L - Lighter hydrocarbons contributed to the quantitation

Y - Sample exhibits fuel pattern which does not resemble standard

NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

ndp - Hydrocarbon reported does not match the pattern of the diesel standard.

µg/L - micrograms per liter

NA - Not analyzed

TPH - Total petroleum hydrocarbons

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

	08/27/01	High	8.54	12.17	3.63	MW

Notes

1- All depth to water measurements are an average of three measurements recorded in the field.

2 - Top of casing elevation is approximate due to damaged casing.

3 - This depth to water (7.68 feet) was measured on 4 June 2002 during sampling.

4 - This depth to water (9.19 feet) was measured at approximately 10:30 AM on 18 March 2003 during sampling.

MW - Monitoring well

-- = Groundwater level measurements were not collected on a tidal schedule beginning with Fourth Quarter 2003.

NM - Not measured

feet PLLW - feet above Presidio Lower Low Water vertical datum.

Notes

feet PLLW - feet above Presidio Lower Low Water vertical datum.

bgs - below ground surface

1 - Groundwater elevations are presented in Table A-1-4.

2 - The screen midpoint elevations are calculated by subtracting the depth to the screen midpoint from the ground surface elevation (Montgomery Watson, 1999i).

3 - Vertical gradients are calculated by dividing the vertical difference in groundwater elevations between two adjacent wells screened in different vertical locations within the water-bearing zone by the vertical difference between the midpoint elevations of the two well screens (Table 3). The value for the shallower well is subtracted from that of the deeper well. A positive value indicates a downward vertical gradient, while a negative number indicates an upward vertical gradient. For the groundwater and screen midpoint elevations, the absolute difference between the elevations and depths are calculated.

FIGURE A-1-7

LANDFILL 8
APPENDIX SECTION A-2
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill 8 is located in the southwestern portion of the Presidio (Figure 1) in the vicinity of the U.S. Public Health Services Hospital (PHSH). The site elevation (Figure A-2-1) is approximately 250 feet above PLLW in the northeast and approximately 190 feet above PLLW in the southwest (Montgomery Watson, 1996b). In 1874, the PHSH was established as a full-service U.S. Merchant Marine Hospital and laboratory. The U.S. Public Health Services took control of the facility in 1927 and operated the hospital until it was closed in November 1981 (Montgomery Watson, 1996b). Landfill 8 was used between the years of 1946 and 1973 to dispose of vegetative debris, miscellaneous building debris, and some garbage and clean fill (Woodward Clyde Consultants, 1990; USACE, 1990).

Groundwater samples have been collected from Landfill 8 monitoring wells since September 1994. Previous laboratory analyses of the groundwater samples included general chemistry, cyanide, metals, VOCs, polycyclic aromatic hydrocarbons (PAHs), organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), and chlorinated herbicides. No PAHs, OCPs, PCBs, or chlorinated herbicides have been detected above laboratory reporting limits at Landfill 8 since monitoring began in September 1994. Summaries of previous dissolved oxygen, general chemistry, cyanide, PAH, OCP, PCB, chlorinated herbicides, VOC, and metals results can be found in Tables A-2-1 through A-2-3.

A reduction in sampling frequency for all Landfill 8 wells to annual was previously approved by the stakeholders and sampling was only conducted during the First Quarter in 2006, in accordance with the approved plan (Table 1A).

2.0 SITE DESCRIPTION AND GEOLOGY

Landfill 8 is a part of the Lobos Creek Groundwater Basin (Figure 1). Groundwater is found at approximately 10 to 50 feet bgs and flows to the southeast. Soils beneath Landfill 8 consist of unconsolidated Colma Formation sedimentary deposits of sand, silt, and clay. These deposits are underlain by Franciscan Formation bedrock (Montgomery Watson, 1996b).

3.0 PUBLIC HEALTH SERVICE HOSPITAL RECORD OF DECISION

In early 1995, the U.S. Army completed the Record of Decision (ROD) for the Former PHS Area (PHS ROD). The PHS ROD addressed three remediation sites within the PHS Area, including Landfill 8. The selected remedy was quarterly groundwater monitoring for five years to confirm that chemicals are not leaching from the fill material to the groundwater.

The quarterly monitoring program at Landfill 8 has met the requirements of the PHS ROD. The *Five Year Review and Field Investigation Work Plan for Landfills 8 and 10* was finalized in October 2002. In order to evaluate remedial actions undertaken in accordance with the 1995 PHS ROD, the Trust will determine whether a ROD amendment or an Explanation of Significant Differences will be required for future site remediation. Potential future remedial actions to be completed at Landfill 8 include construction of a permeable landfill cover or partial landfill removal. A landfill delineation study was completed at Landfill 8 in November 2002. Results of the study will be used in the selection of the final remedy for the site (URS, 2002).

The *Five Year Review and Field Investigation Report for Landfills 8 and 10* (FYR) was submitted to the regulatory agencies and RAB in January 2004 (URS, 2004). A Draft Feasibility Study (FS) for Landfills 8 and 10 has also been prepared (EKI, 2005). Additionally, the Trust is currently writing a RAP and designing new remedial actions for the two landfill sites. The RAP is scheduled to be completed in 2007.

4.0 GROUNDWATER MONITORING

Landfill 8 has five associated monitoring wells and two piezometers (Figure A-2-1). Groundwater elevations were collected from all area wells and piezometers during the Third Quarter 2006, in accordance with Table 1A. Groundwater elevations were not proposed for collection during the Fourth Quarter 2006, in accordance with Table 1B.

Groundwater sampling was not performed in any of the Landfill 8 monitoring wells or piezometers during either the Third or Fourth Quarters 2006. Groundwater sampling and water level measurements will resume in the First Quarter 2007.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 14 August at all five Landfill 8 monitoring wells and both piezometers. A summary of groundwater elevations is presented in Table A-2-4. Water level meters were calibrated on 14 August and the calibration log can be found in Appendix B. Groundwater elevation field forms are presented in Appendix C.

Third Quarter 2006 groundwater elevations ranged from 177.57 to 220.44 feet above PLLW in monitoring wells LF08GW02B and LF08PZ01, respectively. Groundwater flow was determined to be in a southeasterly direction, which follows the general topographic trend. The groundwater

gradient was calculated to be approximately 0.09 feet per foot. A groundwater elevation map showing the Third Quarter 2006 groundwater contours and flow direction for Landfill 8 is included as Figure A-2-1. Groundwater gradients and flow directions are consistent with previous findings at the site.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during the Third Quarter 2006 are consistent with historical values and interpretations.

Until the Landfill 8 RAP has been finalized and implemented, the sampling frequency and groundwater elevation measurements at Landfill 8 will continue to be annual during the First Quarter only. Sampling at Landfill 8 will be performed per the Landfill 8 RAP following the RAP implementation.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Total dissolved solids analysis was mistakenly not marked on the chain-of-custody by the field team and was therefore not analyzed by the laboratory.

3 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO₃ concentrations (nitrate-NO₃) which are 4.43 times higher than nitrate-N concentrations. Section 6.2.1.2 in the main report of the *Draft Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2003, Presidio-Wide Quarterly Groundwater Monitoring Program* discusses this issue (Treadwell & Rollo, 2003e).

mg/L - milligrams per liter

NA - not analyzed

NM - not measured

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

NA - not analyzed

ND - not detected

PAHs - polycyclic aromatic hydrocarbons

OCPs - organochlorine pesticides

PCE - tetrachloroethylene

PCBs - polychlorinated biphenyls

VOC - volatile organic compound

MTBE - methyl tert-butyl ether

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
mg/L - milligrams per liter
µg/L - micrograms per liter
NA - not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

FILL SITE 6
APPENDIX SECTION A-3
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Fill Site 6 is located in the northeastern portion of the Presidio (Figure 1). The site elevation ranges from approximately 10 to 40 feet above the PLLW datum (Montgomery Watson, 1997a). Fill Site 6 is bounded by Lincoln Boulevard to the south, Halleck Street to the west, General Kennedy Avenue to the east, and Doyle Drive to the north (Figure A-3-1). The topography across Fill Site 6 is relatively flat and covered by buildings, streets, paved areas, and landscaping. Fill Site 6 is reported to contain building debris from the original Letterman Army Medical Center, which was demolished in 1975, as well as a variety of other buildings. During construction of the parking lot east of Building 1028 in the 1980s, some building debris was discovered (Dames & Moore, 1997). In the southwest corner of the site, a mounded area relative to the adjacent areas (Fill Site 6A), was formerly present and contained PCB-impacted soil (EKI, 2003).

The Trust installed four monitoring wells (LF6GW100, LF6GW101, LF6GW102, and LF6GW103) in July 2000 to investigate whether Fill Site 6 contains soluble concentrations of chemicals of concern that adversely affect groundwater quality, and to investigate the possibility that fill materials extend west of Girard Road (EKI, 2003).

Groundwater samples collected from Fill Site 6 monitoring wells (Figure A-3-1) have been analyzed for general chemistry, dissolved oxygen, TPHg, TPHd, PAHs, OCPs, PCBs, TDS, and 23 dissolved metals. Additionally, monitoring well 231GW09 was added to the Fill Site 6 monitoring plan to serve as a downgradient well for Fill Site 6A and sampled for general chemistry, dissolved oxygen, TDS, VOCs, MTBE, TPHg, TPHd, TPHfo, dissolved gases, TOC, and dissolved metals. Groundwater analytical results are presented in Tables A-3-1 through A-3-5.

Monitoring well LF6GW102 was abandoned prior to the Second Quarter 2005 in preparation for the Fill Site 6A remedial action, as discussed in Section 3.0 below.

Based on the availability of data associated with the Building 1065 Study Area, Fill Site 6 has been divided into two portions, Fill Site 6A (FS 6A) and Fill Site 6B (FS 6B) (Figure A-3-1). FS 6A addresses the portion of Fill Site 6 bounded by Lincoln Boulevard to the south, Girard Avenue to the east, the area just west of the buildings to the west of Halleck Street, and a sidewalk between Building 227 and 1030 to the north. In FS 6A, PCBs and mercury were present in soil above applicable cleanup

levels. FS 6B soil is currently undergoing further characterization so that remedial actions for FS 6B can be assessed (CDM, 2006).

2.0 SITE DESCRIPTION AND GEOLOGY

Fill Site 6 is located in the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Depth to groundwater ranges from approximately 6 to 22 feet bgs within monitoring wells associated with Fill Site 6. Groundwater level data indicate groundwater flow is generally to the north, towards the San Francisco Bay.

During the drilling of the RI soil borings in the eastern portion of Fill Site 6, two lithologic units were encountered in the area. Underneath the paved areas west of Building 1028, the upper layer consists of fill material extending to a maximum depth of 7 feet bgs. The fill was found to include wood, bricks, concrete, ceramic tiles, asphalt roofing materials, and buckshot (Montgomery Watson, 1999b). The fill is believed to consist largely of building demolition debris. Below the fill is clayey silty sand to well-sorted sand with minor clay layers of the Colma Formation, which is consistent with geologic mapping of the area conducted by Schlocker (Schlocker, 1974). The Franciscan Formation is estimated to be present at approximately 175 feet bgs in this area.

Lithologic units encountered in the southwestern corner of Fill Site 6 include an upper layer of fill material extending to an approximate depth of 15 or more feet, underlain by slope debris, ravine fill, and Colma Formation deposits. The fill consists largely of building demolition debris in a sand matrix and ranges from minor debris to significant sand and concrete foundations and rubble.

3.0 REMEDIAL ACTION PLAN

The *Remedial Action Plan (RAP) for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4*, selected excavation, recycling, and offsite disposal of impacted fill material and underlying soil, along with groundwater monitoring, as the remedial alternative for Fill Site 6A (Figure A-3-1). The goal of the remediation at Fill Site 6A was to remove all contaminated material, leaving in place soil that meets the established cleanup levels (Treadwell & Rollo, 2003b).

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes and residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to comply with the water quality protection standards or the cleanup levels presented in Section 3 of the RAP for three years. Tables A-3-1 through A-3-4 contain RAP groundwater cleanup levels applicable to FS 6A. These cleanup levels are based on the most stringent values for protecting drinking and surface waters. RAP-specified groundwater cleanup levels for some

analytes are slightly lower than their QAPP analytical reporting limits. Applicable RAP-specified cleanup levels are listed on site data tables.

Pre-excavation activities at FS 6A began in the winter of 2004 and excavation began in May 2005. Prior to remediation excavation activities, monitoring well LF6GW102 was abandoned.

The FS 6A remedial excavation was completed in September 2005. Following completion of excavation activities, three new wells (LF6GW104 through LF6GW106) were installed per the RAP and six new piezometers (LF6PZ101 through LF6PZ106) were installed to monitor groundwater levels related to stream restoration at locations shown on Figure A-3-1 (MACTEC, 2006b).

The installation of the new wells and piezometers completes the FS 6A RAP groundwater well monitoring network, which consists of both new and existing wells. The proposed groundwater monitoring program and rationale is presented in Table 10 of the RAP (Treadwell & Rollo, 2003b).

The six new piezometers were constructed using hand-held equipment and were installed directly into native soil. Because no sand pack or grout material was used in the construction of the piezometers, it was subsequently determined that development was not required. The piezometers were measured for groundwater elevation beginning in the First Quarter 2006.

The remainder of Fill Site 6, consisting of FS 6B, is currently being evaluated for potential remedial action alternatives in a future RAP (CDM, 2006).

4.0 GROUNDWATER MONITORING

During the Third and Fourth quarters 2006, six Fill Site 6 associated monitoring wells (LF6GW100, LF6GW101, and LF6GW103 through LF6GW106) and one Building 231/207 Area monitoring well (Figure A-3-1) were proposed for groundwater elevation measurements. Beginning with the Second Quarter 2003, the sampling frequency and analytical suite for monitoring well 231GW09 was modified to serve as a downgradient well for FS 6A (Tables 1A and 1B).

During the Third Quarter 2006, groundwater samples were collected from wells LF6GW103, LF6GW105, LF6GW106 and 231GW09 (Table 1A). Monitoring well LF6GW104 was scheduled for sampling during the Third Quarter 2006, but could not be located because landscaping material covered the area.

During the Fourth Quarter 2006, groundwater samples were collected from monitoring wells LF6GW103 through LF6GW106 and 231GW09, in accordance with Table 1B.

Water level meters were calibrated on 14 August and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

4.1 Groundwater Elevation Measurements

Groundwater elevation measurements were collected from all Fill Site 6 monitoring wells and piezometers proposed, except LF6GW104, during the Third and Fourth Quarters 2006 on 14 August and 4 December 2006, respectively. Monitoring well LF6GW104 was covered during the Third Quarter 2006 and therefore, the groundwater elevation was not measured.

During the Third Quarter 2006, Fill Site 6 groundwater elevations ranged from 11.04 to 19.82 feet above PLLW in monitoring wells LF6GW103 and LF6GW105, respectively (Figure A-3-2). During the Fourth Quarter 2006, groundwater elevations ranged from 10.80 to 19.42 feet above PLLW in monitoring wells LF6GW103 and LF6GW105, respectively (Figure A-3-3). Groundwater elevations are presented in Table A-3-6.

The water level measurements from the six new piezometers (LF6PZ101 through LF6PZ106) ranged in elevation from 9.21 to 13.44 feet above PLLW, during the Third and Fourth Quarters 2006. These water levels are associated with surface stream water levels and are shallower than site groundwater levels, and therefore, they were not used to create groundwater contours.

Fill Site 6 groundwater elevations were evaluated with Building 231/207 and Building 1065/1027 shallow monitoring wells to better understand groundwater flow direction and gradients in this area. Groundwater elevation data for these adjacent sites can be found in Tables A-10-3 and A-11-4, respectively. A discussion of groundwater elevation trends in the Fill Site 6 and Building 1065 vicinity can be found in Appendix A-11.

During the Third and Fourth Quarters 2006, the groundwater flow direction in the Fill Site 6 and surrounding areas was generally north to northeast, towards the San Francisco Bay (Figures A-3-2 and A-3-3). The Third Quarter 2006 groundwater gradient was approximately 0.013 feet per foot. The Fourth Quarter 2006 groundwater gradient was approximately 0.011 feet per foot.

4.2 Monitoring Well Purging and Sampling

The Third Quarter 2006 sampling occurred on 15 and 16 August 2006. The Fourth Quarter 2006 sampling occurred on 5 and 6 December 2006. The Third and Fourth Quarter 2006 sampling at FS 6A was conducted in accordance with methods shown in Tables 1A and 1B of the main text and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water general chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text.

The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the Third and Fourth Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from FS 6A monitoring well LF6GW103 were analyzed for TPHg, TPHd, PAHs, OCPs, PCBs, TDS, general chemistry parameters, and 23 dissolved metals, during the Third and Fourth Quarters 2006.

Monitoring well LF6GW105 and LF6GW106 samples were analyzed for TDS, general chemistry parameters and 23 dissolved metals during the Third and Fourth Quarters 2006. Samples from monitoring well LF6GW106 were also analyzed for PAHs, TPHd and TPHfo during the Third and Fourth Quarters 2006. Monitoring well LF6GW104 could not be located as material was covering the area during the Third Quarter 2006, but was sampled and analyzed for TDS, general chemistry parameters, PAHs, TPHd, TPHfo and 23 dissolved metals during the Fourth Quarter 2006.

Groundwater samples collected from monitoring well 231GW09 were analyzed for TPHg, TPHd, TPHfo, VOCs/MTBE, TDS, sulfide, general chemistry parameters, and 23 dissolved metals, during the Third and Fourth Quarters 2006.

The following sections discuss analytical results collected at Fill Site 6 during the Third and Fourth Quarters 2006.

5.1 Dissolved Oxygen Results

Dissolved oxygen was measured in all wells sampled during the Third and Fourth Quarters 2006. Dissolved oxygen results are presented in Table A-3-2.

During the Third Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.51 to 3.12 mg/L at monitoring wells 231GW09 and LF6GW103, respectively. Dissolved oxygen concentrations were within historical ranges for the Third Quarter 2006. During the Fourth Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.02 to 0.98 mg/L at monitoring wells LFGW105 and LF6GW104, respectively. The dissolved oxygen

concentration measured in monitoring well LF6GW105 during the Fourth Quarter 2006 was a new low concentration. Dissolved oxygen concentrations were generally within historical ranges for the Fourth Quarter 2006.

5.2 General Chemistry Results

Chloride was detected at a new low concentration of 35 mg/L in monitoring well LF6GW103 during the Third Quarter 2006. This low concentration was only slightly outside of the historical low and can be attributed to natural fluctuation. The remaining general chemistry results were within historical ranges during the Third and Fourth Quarters 2006.

5.3 TPH Results

As shown in Table A-3-1, no TPH compounds were detected within any Fill Site 6 associated wells sampled during either the Third or Fourth Quarters 2006. TPH has not exceeded RAP cleanup levels to date within any Fill Site 6 monitoring well samples.

5.4 OCP and PCB Results

Monitoring well LF6GW103 was the only Fill Site 6 monitoring well scheduled for OCP and PCB analysis during the Third and Fourth Quarters 2006. No OCPs or PCBs were detected in LF6GW103 during the Third and Fourth Quarters 2006 as shown in Table A-3-2.

Aldrin was detected, at a concentration of 0.05 µg/L, for the first time at Fill Site 6 in the sample collected from monitoring well LF6GW103 during the Third Quarter 2005. The detected concentration exceeded the RAP-specified cleanup level of 0.00013 µg/L. Based on the fact that aldrin had never been detected in the past and was not detected in the Fourth Quarter 2005 or during 2006, it appears this detection was an anomaly.

5.5 PAH Results

As shown in Table A-3-2, no PAHs were detected in samples from wells LF6GW103 through LF6GW106 during the Third and Fourth Quarters 2006. However, the laboratory detection limits for benzo(a)anthracene, benzo(b)fluoranthene, and chrysene are greater than the RAP-specified cleanup levels.

5.6 Dissolved Metals and TDS Results

Monitoring well samples from LF6GW103, LF6GW105, LF6GW106, and 231GW09 were analyzed for dissolved metals and TDS, during the Third and Fourth Quarters 2006. Monitoring well LF6GW104 could not be located as landscaping material was covering the area during the Third Quarter 2006, but was sampled and analyzed for 23 dissolved metals and TDS during the Fourth Quarter 2006.

The majority of the metal concentrations detected were generally within historical ranges. New high and low dissolved metals concentrations detected during the Third and Fourth Quarters 2006 are discussed below.

Chromium was detected at a new high concentration of 26 µg/L in monitoring well 231GW09 during the Third and Fourth Quarters 2006 and the Fourth Quarter QC duplicate sample had a detection of 30 µg/L. However, the new high concentrations were only slightly outside of the historical high and can be attributed to natural fluctuation.

In the Third Quarter 2006, silver was detected for the first time in the QC duplicate sample collected from LF6GW103 at a concentration of 4 µg/L. Silver was not detected in any of the LF6GW103 samples in the Fourth Quarter 2006.

The remaining dissolved metal results were within historical ranges during the Third and Fourth Quarters 2006 as shown in Table A-3-3. No dissolved metal concentrations were detected above their respective cleanup levels during the Third and Fourth Quarters 2006.

6.0 GROUNDWATER REDOX PARAMETERS

Several parameters were measured in the field and in the laboratory to help determine the redox state of groundwater at Fill Site 6.

The Trust has prepared a *Technical Memorandum: Arsenic and Other Metals in Groundwater at Three Corrective Action Sites, Presidio of San Francisco, California* to aid in evaluating groundwater conditions at CAP sites (MACTEC, 2006a). This technical memorandum discusses the reduction/oxidation (redox) state of groundwater at Fill Site 6 using data collected as part of the Presidio-wide Groundwater Monitoring Program in order to provide upgradient groundwater information for the Building 231/207 and Building 1065 Area CAP sites. Groundwater redox parameter results collected during the Third and Fourth Quarters 2006 were generally within the range of previously detected concentrations at Fill Site 6. Analytical results detected outside of historical bounds are summarized below.

- Dissolved oxygen was measured in monitoring well LF6GW105 during the Fourth Quarter 2006 at a new low concentration of 0.02 mg/L.

Modified redox diagrams were developed for each Fill Site 6 monitoring well sampled. The redox diagrams were generated using the Sequence™ program and concentrations of dissolved oxygen, nitrate, manganese, iron, sulfate and methane and are plotted on Figure A-3-4. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring well location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment.

Fill Site 6 and Building 1065 Area (shallow zone) redox diagrams are shown on Figure A-3-4 to illustrate the differing redox environments across the sites.

7.0 CONCLUSIONS & RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at Fill Site 6 during the Third and Fourth Quarters 2006.

No applicable groundwater cleanup levels were exceeded at Fill Site 6 during either the Third or Fourth Quarters 2006.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - From Table 3 of the RAP (Treadwell & Rollo, 2003c).

3 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.

µg/L - micrograms per liter

NA - Not analyzed

TPH - Total petroleum hydrocarbons

H - Heavier hydrocarbons contributed to the quantitation.

Y - Sample exhibits a fuel pattern that does not resemble the standard

Z - Sample exhibits unknown single peak or peaks.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - From Table 3 of the RAP (Treadwell & Rollo, 2003c). RAP cleanup levels only apply to wells LF6GW103, LF6GW104, LF6GW105, and 231GW09.

µg/L - micrograms per liter
mg/L - milligrams per liter
C° - degrees centigrade
mV - millivolts
ND - Not detected
NR - Not reported
OCPs - Organochlorine pesticides
ORP - Oxidation-reduction potential
PAHs - Polycyclic aromatic hydrocarbons
PCBs - Polychlorinated biphenyls
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
Bold - indicates value above cleanup levels (see note 2 above).
-- Cleanup level not established
NA - Not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - From Table 3 of the RAP (Treadwell & Rollo, 2003c).

3 - Due to computer/review error by the laboratory, sample 231GW09 was not analyzed by ICP-MS for the list of 22 metals. The sample had already been disposed of when the omission was discovered.

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Bold numbers indicate concentrations that exceed cleanup levels.

-- Cleanup level not established.

	04/04/05	0.344	< 0.025 U	0.344	0	100

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

2 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration. As III has been detected at greater concentrations than inorganic As, due to analytical variability. As V is reported as non-detect when As III is detected at a greater concentration than inorganic As.

3 - From Table 3 of the RAP (Treadwell & Rollo, 2003c).

-- Cleanup level not established.

µg/L - micrograms per liter

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - All depth to water measurements are an average of three measurements recorded in the field.

2 - Well was abandoned during the Second Quarter 2005.

3 - The depth to water was improperly recorded as 2.31 feet rather than 12.31 feet on 26 November 2001.

4 - Piezometer water levels are associated with local surface stream water levels.

**BATTERY HOWE/WAGNER
APPENDIX SECTION A-4
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California**

1.0 INTRODUCTION AND BACKGROUND

Battery Howe/Wagner is located in the northwestern portion of the Presidio (Figure 1). The site elevation is approximately 175 to 220 feet above the PLLW datum. The five-acre site is bounded by Battery Wagner Road on the north and east, Upton Avenue to the west, and Ruckman Avenue to the south (Figure A-4-1).

Battery Howe/Wagner was the first 12-inch mortar fortification established in San Francisco (Dames & Moore, 1997). The fortification was constructed in 1893. The date the Battery Howe/Wagner site was decommissioned is unknown, although aerial photographs indicate the site was covered with fill some time between 1963 and 1968. Potential sources of contamination reportedly exist within the debris fill (Montgomery Watson, 1997a).

Erler & Kalinowski, Inc. (EKI) installed three monitoring wells (HWGW100, HWGW101, and HWGW102) at Battery Howe/Wagner in July 2000 (Figure A-4-1). These groundwater monitoring wells were constructed between Building 1233 and existing monitoring wells BHWGW01, BHWGW04, and BHWGW05 to evaluate whether historical releases of carbon tetrachloride or other VOCs, formerly stored within Building 1233, have occurred (EKI, 2000a).

Monitoring wells HWGW100 and HWGW101 were installed, developed, and sampled using low-flow sampling methodologies in July 2000. Groundwater was not observed in monitoring well HWGW102 during drilling or construction. No groundwater samples have ever been collected from well HWGW102.

Groundwater sampling events have taken place at Battery Howe/Wagner since August 1992 and samples collected have been analyzed for VOCs, dissolved and total metals, hexavalent chromium, and general chemistry parameters. Summaries of previous dissolved oxygen, general chemistry, dissolved metals including hexavalent chromium, and VOC results can be found in Tables A-4-1 through A-4-3.

2.0 SITE DESCRIPTION AND GEOLOGY

Battery Howe/Wagner is in the Marina Groundwater Basin (Montgomery Watson, 1996b). Depth to groundwater ranges from approximately 11 to 30 feet bgs. Groundwater flow is generally toward the northeast, but has been reported as both to the east and north (Dames and Moore, 1997).

Artificial and debris fill material lie beneath the Battery Howe/Wagner site at depths ranging from approximately 2.5 to 25 feet bgs. The artificial fill material consists of poorly sorted clay, silt, sand, and gravel, with various types of rock. The debris fill consists mainly of clay and silt with varying amounts of building materials, including glass, wood, brick, concrete, metal strips, and wire. Colma Formation sediments are present below the fill materials and consist of two distinct units: a silty clay colluvium ranging from 0 to 16 feet thick, and a dune sand ranging up to 7 feet thick. Franciscan Formation bedrock underlies the Colma Formation.

3.0 GROUNDWATER MONITORING

Battery Howe/Wagner has six associated monitoring wells (Figure A-4-1). During the Third and Fourth Quarters 2006, groundwater elevation measurements were collected at all Battery Howe/Wagner monitoring wells, except HWGW102, which was dry.

During the Third and Fourth Quarters 2006, groundwater samples were collected from monitoring wells BHWGW01, BHWGW04, BHWGW05, HWGW100, and HWGW101, in accordance with Tables 1A and 1B. Monitoring well HWGW102 was scheduled for sampling during the Third and Fourth Quarters 2006, but was dry.

3.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 14 August and 4 December 2006 at all site wells, except HWGW102 during the Third and Fourth Quarters 2006. Groundwater elevations are summarized in Table A-4-4. Water-level meters were calibrated on 14 August and 4 December 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the Third Quarter 2006, groundwater elevations ranged from 158.14 to 188.74 feet above PLLW in monitoring wells BHWGW01 and HWGW101, respectively. Groundwater flow was in a northeasterly direction, which follows the general topographic trend (Figure A-4-1).

During the Fourth Quarter 2006, groundwater elevations ranged from 157.49 to 186.38 feet above PLLW in monitoring wells BHWGW01 and HWGW101, respectively. Groundwater flow was in a northeasterly direction during the Fourth Quarter 2006, which follows the general topographic trend (Figure A-4-2).

To get a more comprehensive understanding of groundwater flow patterns in this area, Third and Fourth Quarter 2006 Battery Howe/Wagner groundwater elevations were evaluated with the adjacent Mini-CAP monitoring wells (1213GW101, 1221GW101 through 1221GW104, and 1260GW101 through 1260GW103). The addition of these wells indicates that groundwater at the Battery Howe/Wagner site flows northeasterly while groundwater south of the Battery Howe/Wagner site flows to the east. A complete discussion of groundwater flow directions and gradients associated with the adjacent Mini-CAP monitoring wells can be found in Section A-12.

The groundwater elevations measured at the Battery Howe/Wagner site are generally within the range of historical elevations.

The Third and Fourth Quarters 2006 groundwater gradients averaged approximately 0.06 and 0.05 feet per foot, respectively. Monitoring well HWGW102 was not used in the groundwater contouring or gradient calculation during either the Third or Fourth Quarters 2006 because it was dry. Groundwater gradients and flow directions are consistent with previous findings at the site.

3.2 Monitoring Well Purging and Sampling

The Third Quarter 2006 sampling occurred on 15 August 2006. The Fourth Quarter 2006 sampling occurred on 7 December 2006. The Third and Fourth Quarter 2006 sampling at the Battery Howe/Wagner site was conducted in accordance with methods shown in Tables 1A and 1B of the main text and with procedures described in the FSP (Treadwell & Rollo, 2001a). Oxidation reduction potential (ORP), pH, and temperature were measured as part of the lowflow sampling methodology and results are presented in Table A-4-1.

Purge equipment, purging volumes, purge water general chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

3.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text.

The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the Third and Fourth Quarters 2006.

4.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from the Battery Howe/Wagner site were analyzed for general chemistry and 22 dissolved metals, during the Third and Fourth Quarters 2006.

The following sections discuss analytical results collected at the Battery Howe/Wagner site during the Third and Fourth Quarters 2006.

4.1 Dissolved Oxygen Results

Dissolved oxygen was measured in all wells sampled during the Third and Fourth Quarters 2006. Dissolved oxygen results are presented in Table A-4-1.

During the Third Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.52 mg/L at wells BHWGW01 and BHWGW05 to 2.11 mg/L at well HWGW101.

During the Fourth Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.68 mg/L at well BHWGW05 to 2.35 mg/L at HWGW101.

All dissolved oxygen results in the Third and Fourth Quarters 2006 were the range of historical concentrations.

Dissolved oxygen concentrations will continue to be monitored during future sampling events.

4.2 General Chemistry Results

General chemistry results are presented in Table A-4-1. The majority of general chemistry results were within historical ranges during the Third and Fourth Quarters 2006.

The table below summarizes new high and low general chemistry analytical results from the Third and Fourth Quarters 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed. Only the new high or new low data are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
BHWGW04	Chloride	16 / 16	86.1	110	85	--	mg/L
BHWGW05	Fluoride	14 / 15	0.11	0.25	< 0.1	--	mg/L
HWGW100	Nitrate	11 / 11	0.33	1.3	0.11	--	mg/L
HWGW101	Alkalinity, Total	16 / 16	460	640	410	--	mg/L

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
	Bicarbonate	16 / 16	460	640	410	--	mg/L
	Sulfate	16 / 16	84	190	60	--	mg/L

An asterisk (*) indicates qualified data in the above table.

The majority of these detections are only slightly lower than previously detected concentrations and therefore, can be attributed to natural concentration fluctuations.

4.3 Dissolved Metals Results

Monitoring well samples from BHWGW01, BHWGW04, BHWGW05, HWGW100, and HWGW101 were analyzed for 22 dissolved metals during the Third and Fourth Quarters 2006.

The table below summarizes new high and low dissolved metals analytical results from the Third and Fourth Quarters 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced and the number of duplicate analyses performed. Only the new high or new low data are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
BHWGW05	Calcium	12 / 12	35,000	68,000	--	70,000	µg/L
	Magnesium	12 / 12	69,000	76,000	--	80,000	µg/L
HWGW100	Arsenic	3 / 3	7.8	7.8	5.7	--	µg/L
	Barium	2 / 3	< 10	< 10	--	12	µg/L
	Calcium	2 / 3	< 500 *	< 500 *	--	30,000	µg/L
	Chromium	7 / 7	24	49	13	--	µg/L
	Copper	2 / 3	1.4	1.4	< 1	1.8	µg/L
	Magnesium	3 / 3	49,000	49,000	--	140,000	µg/L
	Manganese	2 / 3	< 10	< 10	--	60	µg/L
	Potassium	3 / 3	2,900	2,900	1,700	--	µg/L
	Sodium	3 / 3	220,000	220,000	--	290,000 *	µg/L
HWGW101	Calcium	2 / 3	< 500 *	< 500 *	--	15,000	µg/L
	Chromium	8 / 8	22	35	15	--	µg/L
	Magnesium	3 / 3	26,000	26,000	25,000	--	µg/L
	Potassium	3 / 3	1,600	1,600	780	--	µg/L
	Sodium	3 / 3	260,000	260,000	210,000 *	--	µg/L

An asterisk (*) indicates qualified data in the above table.

Concentrations of barium, calcium, and manganese were significantly higher within monitoring well HWGW100, and the detected concentration of calcium was significantly higher within monitoring well HWGW101 during the Third Quarter 2006. However, Third and Fourth Quarters 2006 were only the second and third times, respectively, that dissolved metals have been analyzed for within these wells. Dissolved metals analysis will continue at these locations in future monitoring events determine if these are increasing trends.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during Third and Fourth Quarters 2006 are consistent with historical values and interpretations.

Dissolved oxygen and general chemistry results during the Third and Fourth Quarters 2006 were generally within historical ranges.

Third and Fourth Quarters 2006 were only the second and third times, respectively, that dissolved metals have been analyzed for in samples from wells HWGW100 and HWGW101. Therefore, analysis for dissolved metals will continue at these and remaining locations in future monitoring events to establish a baseline for HWGW100 and HWGW101 and to determine if metals concentrations are increasing or decreasing.

Notes

- 1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
- 2 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO₃ concentrations (nitrate-NO₃) which are 4.43 times higher than nitrate-N concentrations.

mg/L - milligrams per liter

NA - not analyzed

NM - not measured

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

Table 7 in the main report identifies all duplicate and split samples and associate them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

mV - millivolts

C° - degrees centigrade

ORP - Oxidation-reduction potential

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

NA - not analyzed

ND - not detected

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

Table 7 in the main report identifies all duplicate and split samples and associate them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

NA - not analyzed

ND - not detected

VOC - volatile organic compound

1,1-DCE - 1,1-dichloroethene

MTBE - methyl tert-butyl ether

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

Table 7 in the main report identifies all duplicate and split samples and associate them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

BUILDING 1349 STUDY AREA
APPENDIX SECTION A-5
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Building 1349 Study Area is located in the western portion of the Presidio (Figure 1). Building 1349 is east of Washington Boulevard, west of Harrison Boulevard, and south of Kobbe Avenue (Figure A-5-1). The Building 1349 Area is approximately 310 to 320 feet above the PLLW datum.

Building 1349 was a 100,000-gallon steel aboveground storage tank (AST) built in the 1950s and used in the base-wide fuel distribution system (FDS). The Building 1349 location (Figure A-5-1) was previously occupied by an AST of similar volume, which was built in 1906. A network of pipelines distributed the fuel to various areas throughout the Presidio. Use of the FDS was stopped in the early 1960s and the pipelines were left in place. The Army began an FDS pipeline removal and abandonment project in 1996, which removed most of the FDS pipelines. After the FDS was taken out of service, the AST associated with the FDS was used to store diesel fuel, which was off-loaded to tanker trucks for transportation to various locations in the Presidio (Montgomery Watson, 1996b). The International Technology Corporation (IT) removed Building 1349 in 1996. The Building 1349 monitoring wells are associated with former fueling operations at the Building 1349 Area.

Since the Second Quarter 2001, existing Building 1349 wells have been sampled and analyzed for general chemistry parameters, TPH, VOCs, OCPs, PCBs, PAHs, TDS, chlorinated herbicides, and/or dissolved metals. Summaries of the analytical results are presented in Tables A-5-1 through A-5-7.

The *Final Corrective Action Plan, Building 1349 Study Area, Presidio of San Francisco* (CAP) (BBL, 2006) was submitted to the stakeholders in February 2006 and was approved by the RWQCB in February 2006. Groundwater sampling at the Building 1349 Area will be conducted in accordance with the Final CAP when the CAP is implemented. The recommended corrective actions for the Building 1349 Area are discussed in Section 4.0 of this appendix. Cleanup levels in the Final CAP are presented in Tables A-5-2 through A-5-7.

2.0 SITE DESCRIPTION AND GEOLOGY

The Building 1349 Area is located on a topographic high point on the boundary of the Marina Groundwater Basin and the Coastal Bluffs Groundwater Basin (Figures 1 and A-5-1). Surface and groundwater flow directions vary across the Building 1349 site. Building 1349 monitoring wells 1394MW103, 1349MW104 and 1349MW105 are located within the Marina Groundwater Basin. The six remaining Building 1349 wells are located within the Coastal Groundwater Basin.

Since the Second Quarter 2001, groundwater depths beneath the site have ranged from approximately 15 to 40 feet bgs. Groundwater flow at Building 1349 follows the general topographic trend. Previous groundwater elevation measurements indicate that groundwater beneath the western part of the site consistently flows to the west and southwest towards Fill Site 5 (FS 5) within the Coastal Groundwater Basin (Table A-5-8). Groundwater elevation measurements from wells 1349MW103, 1349MW104, and 1349MW105 indicate that groundwater in this area generally flows in a northeasterly direction within the Marina Groundwater Basin (Table A-5-8) though a northwesterly flow direction was present in the Fourth Quarter 2003, Third and Fourth Quarters 2004, and Third and Fourth Quarters 2006.

Soil units beneath most of the Building 1349 Area consist of Quaternary slope debris and ravine fill. Siltstone, sandstone, shale, and serpentinite of the Franciscan Formation underlie the Quaternary deposits. The slope debris and ravine fill layer is highly variable, consisting of differing combinations and percentages of silts, clays, sands, and gravels and varying in thickness from less than 5 to over 25 feet.

A high-resolution seismic reflection study was previously conducted by Montgomery Watson at the study area (Montgomery Watson, 1996a). The purpose of the study was to assess the depth to bedrock and whether seismic faults and fractures at the site could affect subsurface migration of contaminants. The study identified eight bedrock lineaments or weak zones that transect the site. Treadwell and Rollo conducted a two phase Site Investigation (SI) in 2002 and 2003. Based on the field observations from the first phase of the SI (Phase I SI) and previous boring logs, the underlying bedrock is highly fractured and weathered with varying degrees of hardness. In many of the fracture zones, particularly in the serpentinite units, clay and silt fault gouge with clasts or fragments of more competent rock were observed. Due to the lateral discontinuity and the varying elevations at which they were observed in the soil borings, the extent of these bedrock fractures appears to be limited (Treadwell & Rollo, 2003c). The lineaments and an inferred fault from the Montgomery Watson study are shown on Figure 4 of the *Draft Site Investigation Report (SI), Building 1349 Study Area, Presidio of San Francisco, California*, which was submitted to stakeholders in October 2003 (Treadwell & Rollo, 2003c).

Soil borings advanced during the Phase I SI generally encountered wet soil samples in the bedrock at depths ranging from approximately 30 to 40 feet bgs. After leaving the borings open for at most 48 hours, water levels were measured at depths ranging from 29 to 43 feet bgs,

depending on the boring location. In several of the Phase I SI borings drilled to 40 feet bgs and into the bedrock, groundwater was not present or only a few inches of water had accumulated in the borings after approximately 48 hours. Based on these findings, groundwater appears to be present only in particular locations within bedrock fractures and its occurrence is laterally discontinuous across the site. Groundwater movement likely follows the fractures within the bedrock and flows downslope following surface topography (Treadwell & Rollo, 2003c).

3.0 BUILDING 1349 STUDY AREA CAP

The Building 1349 Area CAP was submitted to the stakeholders in February 2006 and was approved in February 2006. The CAP identifies four Remedial Units (RUs). The RUs and their recommended alternatives are discussed below.

- Shallow Soil RU – The recommended alternative for the Shallow Soil RU is Excavation and Off-Site Disposal.
- Deep Soil RU – The recommended alternative for the Deep Soil RU is Excavation and Off-Site Disposal.
- Telecommunications Corridor Soil RU – The recommended alternative for the Telecommunications Corridor Soil RU is Excavation and Off-Site Disposal.
- Groundwater RU – The recommended alternative for the Groundwater RU is Groundwater Monitoring.

Groundwater sampling at the Building 1349 Area will be conducted in accordance with Table 5-2 of the CAP following the implementation of the CAP. CAP cleanup levels are presented in Tables A-5-2 through A-5-7.

4.0 GROUNDWATER MONITORING

Building 1349 currently has nine associated monitoring wells (Figure A-5-1). Groundwater elevations were collected at all nine Building 1349 monitoring wells during both the Third and Fourth Quarters 2006, except 1349MW102 during the Fourth Quarter 2006.

All four Building 1349 Area wells (1349MW03R, 1349MW100, 1349MW101, and 1349MW102) proposed for sampling were sampled during the Third Quarter 2006, in accordance with Table 1A. Well 1349MW100 was the only well sampled during the Fourth Quarter 2006, in accordance with Table 1B.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected within all Building 1349 Area monitoring wells on 14 August and 4 December 2006, except 1349MW102 during the Fourth Quarter 2006. Monitoring well 1349MW102 was covered with landscaping material during the Fourth Quarter 2006 and therefore, was not accessible. Groundwater elevations are presented in Table A-5-8. Groundwater elevations of nearby FS 5 wells can be found in Table A-9-8. Water level meters were calibrated on 14 August and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

To provide a broader understanding of groundwater gradients and flow directions in the Building 1349 Area, FS 5 and Baker Beach Disturbed Area 3 groundwater elevations were evaluated with Building 1349 Area groundwater elevations. After having high groundwater elevations observed during the First and/or Second Quarters 2006, the elevations measured within the Building 1349 Area during the Third and Fourth Quarter 2006 are generally trending back to within historical ranges. The higher groundwater levels measured in the First and Second Quarters 2006 were likely due to the higher than normal precipitation in late 2005 and early 2006. Groundwater elevation maps showing the Third and Fourth Quarters 2006 groundwater contours and flow directions for the Building 1349/Fill Site 5 Area are included as Figures A-5-1 and A-5-2, respectively.

Third Quarter 2006 groundwater elevations ranged from 277.65 to 288.88 feet above PLLW in Building 1349 Area monitoring wells 1349MW01 and 1349MW101, respectively (Figure A-5-1). Fourth Quarter 2006 groundwater elevations ranged from 276.25 to 285.17 feet above PLLW in Building 1349 Area monitoring wells 1349MW01 and 1349MW105, respectively (Figure A-5-2).

Building 1349 Area groundwater was observed to flow in two distinct directions during the Third and Fourth Quarter 2006 depending on which side of the groundwater basin boundary the wells are located. Groundwater in the Coastal Bluffs Groundwater Basin (wells 1349MW01, 1349MW02, 1349MW03R, and 1349MW100 through 1349MW102) was measured to flow southwesterly during both the Third and Fourth Quarter 2006 while groundwater in the Marina Groundwater Basin (wells 1349MW103 through 1349MW105) was measured to flow west in the Third Quarter 2006 and northwesterly in the Fourth Quarter 2006.

During the Third and Fourth Quarters 2006, the southwesterly groundwater gradient at Building 1349 and FS 5 was calculated to be approximately 0.11 and 0.13 feet per foot, respectively. Groundwater elevations were not collected at FS 5 during the Fourth Quarter 2006. During the Third Quarter 2006 the groundwater gradient in the vicinity of monitoring wells 1349MW103 through 1349MW105 was estimated to be approximately 0.017 feet per foot. During the Fourth Quarter 2006, the groundwater gradient in the vicinity of monitoring wells 1349MW103 through 1349MW105 was estimated to be approximately 0.019 feet per foot. Groundwater flow directions and gradients are consistent with the majority of previously calculated flow directions

and gradients at the site, as the groundwater flow direction in the area of monitoring wells 1349MW103 through 1349MW105 has previously ranged from the northeast to the northwest.

4.2 Monitoring Well Purging and Sampling

All four Building 1349 Area monitoring wells scheduled for sampling during the Third Quarter 2006 (1349MW03R, 1349MW100, 1349MW101, and 1349MW102) were purged and sampled on 16 and 17 August 2006. Monitoring well 1349MW100, which was the only well scheduled to be sampled during the Fourth Quarter 2006, was purged and sampled on 5 December 2006. All Building 1349 Area monitoring wells were purged and sampled using methods shown in Tables 1A and 1B, and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, volumes, and general chemistry parameters for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon polyethylene AST located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are described in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed for the Third and Fourth Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

All groundwater samples collected from Building 1349 Area monitoring wells during the Third Quarter 2006 were analyzed for OCPs (Table 1A). In addition, samples from monitoring well 1349MW100 were also analyzed for general chemistry parameters, VOCs, PAHs, PCBs, TPHg, TPHd, TPHfo, TDS, and 23 dissolved metals (Table 1A).

Groundwater samples collected from Building 1349 Area monitoring well 1349MW100 during the Fourth Quarter 2006 were analyzed for general chemistry parameters, OCPs, VOCs, PAHs, TPHg, TPHd, TPHfo, TDS and 23 dissolved metals (Table 1B).

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the Presidio QAPP, with a carbon range of C₂₄ to C₃₆. Section 5.4.3.1 in the main report discusses the data compatibility issues associated with TPH analyses.

Potential contaminants of concern and their associated cleanup levels are listed in the CAP (BBL, 2006). Applicable cleanup levels are also listed in Tables A-5-1 through A-5-7, which present groundwater analytical results. Third and Fourth Quarter 2006 detected groundwater analytical results are summarized below and compared to the cleanup levels where applicable.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-5-1. Dissolved oxygen results measured during the Third and Fourth Quarters 2006 were within historical ranges. During the Third and Fourth Quarters 2006, dissolved oxygen was measured within historical ranges at 1349MW100 at concentrations of 0.81 and 1.6 mg/L respectively. However, the Fourth Quarter 2006 concentration of 1.6 mg/L within 1349MW100 is the highest measured in this well since the Second Quarter 2003.

5.2 General Chemistry Results

General chemistry results are presented in Table A-5-1. General chemistry results for the Third and Fourth Quarters 2006 within Building 1349 Area monitoring well 1349MW100 were generally within historical ranges, with the following exceptions.

Total alkalinity and bicarbonate were measured at new high concentrations of 1,000 mg/L in monitoring well 1349MW100 during the Fourth Quarter 2006. These new high concentrations were only slightly above the historical high (970 mg/L) and can be attributed to natural fluctuation. The remaining general chemistry results were within historical ranges during the Third and Fourth Quarters 2006.

5.3 TPH Results

Results of TPH analyses are presented in Table A-5-2 and on Figure A-5-3. TPHg was detected above its Building 1349 Area CAP cleanup level (770 µg/L) during the Third and Fourth Quarters 2006 at 1349MW100 at 820 and 1,200 µg/L, respectively. TPHd was also detected within this well above its Building 1349 Area CAP cleanup level (880 µg/L) during both the Third Quarter and Fourth Quarters 2006. The TPHd detection during the Third Quarter 2006 was the highest concentration detected to date in this well, 42,000 µg/L, and is significantly higher than the Second Quarter 2006 concentration of 5,400 µg/L. The Fourth Quarter 2006 TPHd concentration in 1349MW100 decreased to 13,000 µg/L. TPH concentrations at the site have generally been non-detect with the exception of TPHg and TPHd concentrations in 1349MW100. TPHd concentrations continue to exceed groundwater cleanup levels within monitoring well 1349MW100, and both TPHg and TPHd concentrations continue to fluctuate significantly from one sampling event to the next at this location.

TPHfo was not detected in 1349MW100 groundwater samples during the Third and Fourth Quarter 2006.

5.4 VOC Results

Results of VOC analyses are presented in Table A-5-3. VOC analyses were only performed in monitoring well 1349MW100 during the Third and Fourth Quarters 2006, in accordance with Tables 1A and 1B. VOCs were detected in monitoring well 1349MW100 during the Third and Fourth Quarter 2006 at concentrations discussed below.

Benzene was detected during the Third and Fourth Quarters 2006 within monitoring well 1349MW100 at concentrations of 23 and 18 µg/L, respectively. Both detected concentrations were above the CAP-specified cleanup level of 1 µg/L. These benzene concentrations are within the historical range of concentrations for 1349MW100.

Total xylenes were not detected above laboratory limits during the Third Quarter 2006; however, total xylenes were detected at a concentration of 2.3 µg/L during the Fourth Quarter 2006. This total xylenes concentration is within the historical range of concentrations for 1349MW100. No other VOCs were detected during the Third Quarter 2006. Ethylbenzene was not detected above reporting limits for the first time within monitoring well 1349MW100 during the Third Quarter 2006.

VOC concentrations at 1349MW100 continue to fluctuate. The potential for increasing or decreasing VOC concentration trends at the site will continue to be evaluated in future monitoring events, in accordance with the CAP.

5.5 OCP and PCB Results

OCP and PCB results are presented in Table A-5-4 and are illustrated on Figure A-5-3. PCBs were not detected in 1349MW100 during the Third Quarter 2006 and have not been detected within any Building 1349 Area monitoring wells to date.

No OCPs were detected in any wells sampled, other than 1349MW100 during the Third and Fourth Quarters 2006. Several OCPs were detected in monitoring well 1349MW100 during Third and Fourth Quarters 2006 and are discussed below.

- Endrin was detected at a new high concentration of 0.7 µg/L during the Third Quarter 2006, which is slightly higher than the previous high concentration of 0.2 µg/L detected in the Second Quarter 2004. However, these concentrations are below the CAP cleanup level of 2 µg/L.
- Gamma-BHC, 4,4'-DDT, heptachlor, and heptachlor epoxide were all detected within 1349MW100 at concentrations exceeding their respective CAP-specified cleanup levels during the Third Quarter 2006.

- During the Fourth Quarter 2006, 4,4'-DDE, dieldrin, and heptachlor were detected within 1349MW100 at concentrations of 0.3, 0.3 and 0.2 µg/L, respectively. The 4,4'-DDE and heptachlor detections are above their respective CAP-specified cleanup levels for these compounds.

OCPs have also been detected in the past in monitoring wells 1349MW03R, 1349MW101, and 1349MW102, which are generally downgradient of monitoring well 1349MW100, where OCPs have at times exceeded the applicable cleanup levels (BBL, 2006). However, OCPs have not been detected within any of these wells for six or more sampling events.

OCPs were not documented in the SI as potential contaminants of concern at the Building 1349 Area. Former Building 1349 operations involved fuel storage and distribution. The source of OCP concentrations is not currently known, therefore, the potential for increasing or decreasing OCP concentration trends at the site will continue to be evaluated in future monitoring events.

5.6 PAHs

PAH results are presented in Table A-5-5. Monitoring well 1349MW100 was the only well sampled for PAHs during the Third and Fourth Quarters 2006. Significant detections are discussed below.

Several PAHs were detected within monitoring well 1349MW100 during the Third and Fourth Quarters 2006. Of the PAHs detected, benzo(a)anthracene was detected at concentrations exceeding its CAP-specified cleanup level during both Third and Fourth Quarters 2006. Benzo(a)anthracene has historically been detected above its cleanup level within this well. Benzo(b)fluoranthene was detected at a concentration exceeding its CAP-specified cleanup level during the Fourth Quarter 2006. Fluoranthene was detected at a new high concentration of 41 µg/L during the Fourth Quarter 2006, which is significantly higher than the previously detected high concentration of 22 µg/L in the Fourth Quarter 2005 but does not exceed the CAP-specified cleanup level.

Acenaphthene, anthracene, benzo(k)fluoranthene, chrysene, fluorene, and pyrene were also detected below CAP cleanup levels during the Third and/or Fourth Quarters 2006.

With the exception of fluoranthene, the concentrations of PAHs detected within 1349MW100 were within historical ranges.

5.7 Dissolved Metals Results

Dissolved metals results are presented in Table A-5-7 and arsenic, chromium, and iron results are illustrated in Figure A-5-3. In accordance with the proposed sampling schedules, only groundwater samples collected from monitoring well 1349MW100 were analyzed for dissolved metals during the Third and Fourth Quarters 2006 (Tables 1A and 1B).

The majority of the dissolved metal concentrations detected during the Third and Fourth Quarter 2006 are within historical ranges.

- Arsenic was detected above the CAP-specified cleanup level of 10 µg/L during the Fourth Quarter 2006 at a concentration 12 µg/L in well 1349MW100. Arsenic concentrations continue to fluctuate within this well around the CAP-specified cleanup level.
- Sodium was detected at a new high concentration of 480,000 µg/L in the Third Quarter 2006.

Dissolved iron, manganese, and arsenic were detected within historic ranges during the Third and Fourth Quarters 2006. Typically, the concentration of these redox sensitive metals increase or decrease together depending on changing redox conditions. Future concentrations of these metals will continue to be evaluated.

6.0 CONCLUSIONS & RECOMMENDATIONS

Four Building 1349 monitoring wells were sampled during the Third Quarter 2006. Only well 1349MW100 was sampled during the Fourth Quarter 2006.

The Building 1349 Study Area Final CAP was submitted to the stakeholders in February 2006, and was approved by the RWQCB in February 2006. Groundwater sampling at the Building 1349 Area will be conducted in accordance with the Final CAP when the CAP is implemented. The recommended corrective actions for the Building 1349 Area are discussed in Section 4.0 of this appendix. Cleanup levels in the Final CAP are presented in Tables A-5-2 through A-5-7.

TPH, OCP, PAH and VOC concentrations continue to be detected in monitoring well 1349MW100 groundwater samples above CAP-specified cleanup levels. The majority of the dissolved metal concentrations detected during the Third and Fourth Quarter 2006 are within historical ranges. Arsenic was detected above the CAP-specified cleanup level of 10 µg/L during the Fourth Quarter 2006 at a concentration 12 µg/L in well 1349MW100. Arsenic concentrations continue to fluctuate within this well around the CAP-specified cleanup level.

Groundwater concentration trends, within both monitoring well 1349MW100 and the remaining wells associated with Building 1349 Study Area, will continue to be monitored and evaluated.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly report.

2 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO₃ concentrations (nitrate-NO₃) which are 4.43 times higher than nitrate-N concentrations. Section 6.2.1.2 in the main report discusses this issue.

mg/L - milligrams per liter

mV - millivolts

NA - Not analyzed

NM - Not measured

NR - Not reported

ORP - oxidation reduction potential

°C - degrees centigrade

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Final Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California* (BBL, 2006).

3 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain-of-custody. Concentrations in **bold** indicate an exceedance of applicable cleanup levels (BBL, 2006).

µg/L - micrograms per liter

NA - Not analyzed

TPH - Total petroleum hydrocarbons

Y - Sample exhibits fuel pattern that does not resemble the standard.

CL suffix denotes a quality control duplicate sample was sent to control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Final Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California* (BBL, 2006).

Concentrations in **bold** indicate an exceedance of applicable cleanup levels.

"--" cleanup level not established

µg/L - micrograms per liter

ND - Not detected

NA - Not analyzed

NS - Not sampled

VOC - Volatile organic compound

MTBE - Methyl tert-butyl ether

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Final Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California* (BBL, 2006).

Bold numbers indicate detected concentrations which exceed drinking water quality criteria.

µg/L - micrograms per liter

-- cleanup level not established

ND - Not detected

NA - Not analyzed

- The continuing calibration verification (CCV) drifted outside the limits although the average CCV drift was within method requirements.

OCPs - Organochlorine pesticides

PCBs - Polychlorinated biphenyls

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Final Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California* (BBL, 2006).

BOLD concentrations indicate an exceedance of applicable cleanup levels.

-- cleanup level not established

µg/L - micrograms per liter

ND - Not detected

NS - Not sampled

PAHs - Polycyclic aromatic hydrocarbons

CL suffix denotes a quality control duplicate sample was sent to control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Results of Army and Trust studies support the hypothesis that dissolved chromium and hexavalent chromium measured in groundwater in upland areas of the Presidio appear to be naturally occurring and derived from serpentinite.

Hexavalent chromium was not retained as a COC in the *Final CAP* (BBL, 2006).

3 - Groundwater cleanup levels were taken from the *Final Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California* (BBL, 2006).

Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

-- cleanup level not established

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

**FILL SITE 1, LANDFILL 2, EL POLIN SPRING
TENNESSEE HOLLOW, AND UPGRADIENT WELLS
APPENDIX SECTION A-6
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California**

1.0 INTRODUCTION AND BACKGROUND

The Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, and Upgradient Wells area monitoring wells are located in the southeastern portion of the Presidio (Figure 1). Fill Site 1 is north of the Julius Kahn Public Playground. The site vicinity includes the El Polin Spring picnic area and the El Polin Spring sampling location (Figure A-6-1). The elevation at Fill Site 1 ranges from approximately 100 to 150 feet above the PLLW datum (Montgomery Watson, 1996b). The elevation at Landfill 2 ranges from approximately 140 to 240 feet above the PLLW datum. The Tennessee Hollow and the Upgradient Wells area monitoring wells have surface elevations ranging from approximately 45 to 110 feet and 170 to 265 feet above the PLLW datum, respectively.

Debris fill materials were disposed in Fill Site 1 from 1948 until 1973. Landfill 2 was in operation from 1946 to 1973 and was used for disposal of building debris and other wastes (Dames and Moore, 1997; Ringden and Sitton, 1990). Potential sources of contamination exist in fill materials disposed at both Fill Site 1 and Landfill 2. The Upgradient Area and Tennessee Hollow wells are currently being used to monitor groundwater elevations only, and are not sampled.

Groundwater sampling began in November 1990 at Fill Site 1 and Landfill 2. Groundwater samples have been analyzed for some or all of the following: general chemistry parameters, VOCs, SVOCs, OCPs, PCBs, chlorinated herbicides, TPH, dissolved metals, and cyanide. No OCPs, PCBs or chlorinated herbicides have ever been detected in any of the monitoring wells currently being monitored at the site. A summary of historical groundwater analytical results can be found in Tables A-6-1 through A-6-4.

Prior to the Fourth Quarter 2006, the frequency of groundwater elevation measurements was reduced to annual, to occur during the First Quarter.

2.0 SITE DESCRIPTION AND GEOLOGY

Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, and Upgradient Wells Areas are located within the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Groundwater generally flows northward across the site towards the Crissy Field Groundwater Area (Montgomery Watson, 1996b).

Fill Site 1 and Landfill 2 have 10 associated monitoring wells (LF01GW01 through LF01GW07, and LF02GW01, LF02GW02, and LF02GW04) and one surface water sampling location (EPSP01) (Figure A-6-1). The Tennessee Hollow Area has four monitoring wells (TH-1, TH-2, TH-3, and TH-4), and the Upgradient Wells Area has five monitoring wells (UBR01GW01, UBR02GW01, UBR02GW02, UBR03GW01, and UBR03GW02). Two additional monitoring wells (10GW100 and PGFGW100) located near Building 10 and Paul Goode Field are monitored for groundwater elevation on an annual basis in the First Quarter. Monitoring well 300GW01, located near the Presidio Golf Course, was approved for removal from the Presidio-wide Groundwater Monitoring Program during the Third Quarter 2005 and will no longer be measured. Two monitoring wells (100GW101 and 104GW101) were installed adjacent to Buildings 100 and 104 in October 2002. These two wells have had four consecutive quarters of non-detect sampling results and therefore were removed from the sampling schedule beginning with the Second Quarter 2004. Abandonment of these wells will be proposed in the Mini-CAP Group II document, which is currently being prepared.

The Northeastern Groundwater Area is covered with grasses, annual plants, and trees and is occupied by Presidio housing. Fill Site 1 and Landfill 2 are located in the Tennessee Hollow Valley. The Landfill 2 site is approximately 300 feet west of Fill Site 1 (Figure A-6-1). Landfill 2 is in a hilly, densely forested area. Fill Site 1 contains fill from the ground surface to approximately 34 feet bgs. The fill at Fill Site 1 consists of sand and gravel with varying amounts of construction debris. The fill layer at Landfill 2 extends from the ground surface to 20 feet bgs. The fill material found in Landfill 2 consists of glassware, hospital debris, wood, and general construction debris. The fill layer at both sites is underlain by laterally bedded, fine-grained, silty sand of the Colma Formation. Serpentinite rock of the Franciscan Formation lies beneath the Colma Formation and was encountered at depths ranging from 40 to 79 feet bgs (Montgomery Watson, 1996b). The five Upgradient wells (UBR01GW01, UBR02GW01, UBR02GW02, UBR03GW01, and UBR03GW02) are screened in Franciscan Formation bedrock.

3.0 GROUNDWATER MONITORING

Groundwater elevations were measured within all monitoring wells proposed during the Third Quarter 2006. No groundwater elevation measurements were taken during the Fourth Quarter 2006 as groundwater elevation measurements were reduced to annual after Third Quarter 2006 to match the sampling frequency at the site. Groundwater elevations will be measured during the First Quarter 2007.

3.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on August 14 2006 at all site wells proposed, except UBR01GW01. Monitoring well UBR01GW01 was covered in gravel during the Third Quarter 2006 and could not be located. Groundwater elevations are summarized in Table A-6-5. Groundwater elevations measured are consistent with historical values. Water level meters were calibrated on 14 August 2006 and the calibration forms can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

Third Quarter 2006 groundwater elevations ranged from 34.09 to 244.68 feet above PLLW in monitoring wells 10GW100 and UBR02GW01, respectively. A Third Quarter 2006 groundwater elevation map showing groundwater contours and flow directions for Fill Site 1, Landfill 2, Tennessee Hollow, and Upgradient Wells is included as Figure A-6-2. During the Third Quarter 2006, groundwater flow was in northeasterly, northerly, and northwesterly directions, following the general topographic trend. The groundwater gradient was estimated to be approximately 0.16 feet per foot to the northeast, approximately 0.03 feet per foot to the north, and approximately 0.07 feet per foot to the northwest.

Upgradient well UBR02GW01 is adjacent to and screened deeper than UBR02GW02, and upgradient well UBR03GW01 is adjacent to and screened deeper than UBR03GW02. Groundwater elevations in wells UBR02GW01 and UBR03GW01 have a different potentiometric surface than the adjacent wells that are screened shallower and were not used in constructing groundwater contours or calculating groundwater gradients in the shallow aquifer.

The groundwater elevation within monitoring well 10GW100 was evaluated with nearby Commissary/PX Area monitoring wells during the Third Quarter 2006 as shown in Figure A-6-3. Groundwater flow was to the north in the Third Quarter 2006 and the gradient in the area was estimated to be 0.017 feet per foot. Groundwater elevation data associated with the Commissary/PX Area can be found in section A-16.

3.2 Monitoring Well Purging and Sampling

No groundwater samples were collected from Fill Site 1, Landfill 2, or El Polin Spring monitoring wells during the Third or Fourth Quarters 2006, in accordance with the proposed sampling plans Table 1A and 1B. Groundwater samples were last collected at Fill Site 1, Landfill 2, and El Polin Spring during the First Quarter 2006. Groundwater samples are not scheduled to be collected from Fill Site 1, Landfill 2, and El Polin Spring monitoring wells until the First Quarter 2007.

Historical groundwater analytical results for Fill Site 1, Landfill 2, and El Polin Spring are presented in Tables A-6-1 through A-6-4.

4.0 CONCLUSIONS & RECOMMENDATIONS

Groundwater elevations and flow directions measured during the Third Quarter 2006 were consistent with historical measurements. Groundwater sampling will continue at Fill Site 1, Landfill 2, and El Polin Spring during First Quarter 2007.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - The QC laboratory nitrate results have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported.

The QC laboratory reported nitrate as NO3 concentrations (nitrate-NO3) which are 4.43 times higher than nitrate-N concentrations.

mg/L - milligrams per liter

NA - Not analyzed

NM - Not measured

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

NA - Not analyzed

ND - Not detected

PAHs - Polycyclic aromatic hydrocarbons

OCPs - Organochlorine pesticides

PCBs - Polychlorinated biphenyls

VOC - Volatile organic compound

MTBE - Methyl tertiary-butyl ether

SVOCs - Semivolatile organic compounds

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

NA - Not analyzed

TPH - Total petroleum hydrocarbons

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes:
Groundwater elevation data collected on 14 August 2006.

Groundwater elevations for UBR02GW01 and UBR03GW01 were not used in groundwater contouring.

300GW01 was approved for removal from the groundwater monitoring program prior to the First Quarter 2006.

Landfill E wells DAEGW06 and DAEGW07 were not contoured, due to semi-confined and perched conditions, respectively. Whereas, well DAEGW101 was not contoured because it is screened in a deeper interval.

Third Quarter 2006

Fourth Quarter 2006

LANDFILL E
APPENDIX SECTION A-7
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill E is located in the east-central portion of the Presidio (Figure 1). The site is bounded by hillsides to the west and south, housing to the east, Quarry Road to the southeast, and Hicks Road and Barnard Avenue to the northwest (Figure A-7-1). The site elevation ranges from approximately 70 to 140 feet above the PLLW vertical datum.

The ravine northeast of Landfill E operated as a firing range, the former Barnard Avenue Protected Target Range, from 1910 to the mid-1920s (Montgomery Watson, 1996c). The southern portion of the range is currently covered by Landfill E. Filling began at Landfill E prior to 1946 and was terminated between 1965 and 1973 (ANL, 1989). Pop Hicks baseball field was constructed in the landfill area in the late 1950s (Montgomery Watson, 1996c).

Since August 1992, groundwater samples from Landfill E have been analyzed for TPH, VOCs, PAHs, OCPs and PCBs, chlorinated herbicides, metals, TDS and general chemistry. No OCPs, PCBs or chlorinated herbicides have ever been detected in groundwater at the site. Landfill E monitoring well analytical results are present in Tables A-7-1 through A-7-4.

Monitoring wells DAEGW03, DAEGW05, and DAEGW08 were also sampled for perchlorate and polybrominated diphenyl ether (PBDE) as part of the Trust's Emergent Chemical Study conducted at the request of the RWQCB during the First Quarter 2004. No perchlorate or PBDE was detected above laboratory reporting limits during the Emergent Chemical Study (Treadwell & Rollo, 2004c).

2.0 SITE DESCRIPTION AND GEOLOGY

Landfill E is located at the edge of the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Depth to groundwater beneath Landfill E has ranged from approximately 9 to 60 feet bgs. The groundwater flow direction around Landfill E is generally northeasterly, towards Crissy Field (Montgomery Watson, 1997a).

A fenced field and a paved parking lot currently occupy the majority of the site (Figure A-7-1). Soils in the area of Landfill E generally consist of fill materials underlain by the Colma Formation and serpentinite bedrock. The fill material under the Landfill E footprint extends to a maximum depth of approximately 38 feet bgs. The debris fill consists of glass, brick, tile, and

other general construction debris (Dames & Moore, 1997). The fill layer is underlain by Colma Formation clay, silt, and sand. The Colma Formation is at least 25 feet thick. Franciscan Formation bedrock lies beneath the Colma Formation. The bedrock consists of weathered serpentinite and is found at depths ranging from 40 to 79 feet bgs (Montgomery Watson, 1997a).

3.0 DRAFT LANDFILL E FEASIBILITY STUDY REPORT

A Draft Feasibility Study (FS) for Landfill E was completed in 2005 (CH2MHill, 2005). The preferred alternative selected by the FS is a landfill cover system with geosynthetic material, landfill gas collection and monitoring, groundwater monitoring and enhancement of the Tennessee Hollow corridor on the west side of the landfill by consolidation of some of the fill to the east. A RAP is scheduled to be completed in 2008.

4.0 GROUNDWATER MONITORING

Landfill E has 10 associated groundwater monitoring wells, two piezometers, and one seep (Figure A-7-1). During the Third Quarter 2006, groundwater elevation measurements were collected at all 12 wells and piezometers (Table A-7-5). No groundwater samples were proposed during the Third or Fourth Quarters 2006 from Landfill E monitoring wells, however, collecting a surface water sample from Landfill E seep (DAESP03) was proposed (Tables 1A and 1B). The proposed sampling frequency at Landfill E seep (DAESP03) was increased to quarterly beginning with the First Quarter 2006 to assess seasonal and variable conditions. This seep typically only flows during the First Quarter when rainfall is heavy. The approximate location of DAESP03 is presented on Figure A-7-1.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements for the Third Quarter 2006 were collected on 14 August 2006 at all site wells and piezometers with the exception of monitoring well DAEGW101 which was measured on 23 August 2006. Groundwater elevations were not collected in the Fourth Quarter 2006, in accordance with Table 1B. Beginning in the Fourth Quarter 2006, the frequency of water level measurements was reduced to an annual basis to match the sampling frequency for groundwater wells at the site. The next water level measurements at Landfill E will be performed in the First Quarter 2007. Landfill E seep (DAESP03) was not flowing during the Third or Fourth Quarters 2006. Groundwater elevations are presented in Table A-7-5. Water level meters were calibrated on 14 August and 23 August 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the Third Quarter 2006, groundwater elevations ranged from 53.23 feet above PLLW in monitoring well DAEGW04 to 106.59 feet above PLLW in monitoring well DAEGW06. Groundwater flow was to the northeast following the general topographic trend, which is consistent with previous interpretations. The groundwater gradient was calculated to be

approximately 0.12 feet per foot, which is consistent with previous quarters. A groundwater elevation map showing Third Quarter 2006 groundwater contours and flow directions for Landfill E is included as Figure A-7-1.

The groundwater elevations for the Third Quarter 2006 are generally within the range of historical elevations measured at the site. Groundwater elevations from wells DAEGW06, DAEGW07, and DAEGW101 have not been used in calculating groundwater gradients or determining flow directions during this quarter or previous quarters. Monitoring well DAEGW06 had a groundwater elevation of 106.59 feet above PLLW during the Third Quarter 2006. This well is located southwest of the other site wells and was previously interpreted as being installed in a semi-confined aquifer. Groundwater within well DAEGW07 was measured at 66.26 feet above PLLW during the Third Quarter 2006. This groundwater elevation represents perched groundwater conditions. DAEGW101 is screened in a shallower interval of the unconfined aquifer. Wells DAEGW03, DAEGW04, DAEGW05, DAEGW08, DAEGW102 through DAEGW104 and piezometers DAEPZ101 and DAEPZ102 are screened in an unconfined aquifer (Montgomery Watson, 1999d and EKI & Golder Associates, 2003).

4.2 Monitoring Well Purging and Sampling

In accordance with the proposed sampling schedules, groundwater samples were not collected in monitoring wells or piezometers at Landfill E in either the Third or the Fourth Quarters 2006. The collection of surface water samples from Landfill E seep DAESP03 was attempted in the Third and Fourth Quarters 2006, but was not possible because the seep was not flowing.

4.3 Groundwater Analytical Program

In accordance with the sampling schedule and due to non-flowing conditions at Landfill E seep DAESP03, no water samples were analyzed during either the Third or Fourth Quarter 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

In accordance with the proposed sampling schedule and due to non-flowing conditions at Landfill E seep DAESP03, water samples were not collected in either the Third or the Fourth Quarter 2006, thus there are no analytical results.

6.0 CONCLUSIONS & RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at Landfill E during the Third Quarter 2006.

The proposed sampling frequency at Landfill E seep (DAESP03) was increased to quarterly beginning with the First Quarter 2006 to assess seasonal and variable conditions. All other site wells are sampled on an annual basis in the First Quarter of each year. Due to the non-flowing conditions in Landfill E seep DAESP03, no groundwater samples were collected, thus there were no analytical results for the Third and Fourth Quarters 2006.

A FS has been prepared for Landfill E (CH2MHill, 2005). The reduction to annual sampling at monitoring wells DAEGW03 through DAEGW08 until a Landfill E RAP have been finalized was approved by the stakeholders prior to First Quarter 2004. Sampling will be performed per the RAP once it has been finalized and implemented.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly reports.

2 - This sample was labeled LFE-GW on the chain of custody and was reported by the laboratory as LFE-GW. This sample ID (LFE-GW) has been changed within the text, tables and database to reflect the historic name of this seep (DAESP03).

3 - This sample was labeled LFE-GWD on the chain of custody and was reported by the laboratory as LFE-GWD. In accordance with the QAPP, this sample ID (LFE-GWD) was changed to DUP112801 within the text, tables and database.

mg/L - milligrams per liter

NA - Not analyzed

NM - Not measured

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical method used during previous quarters are identified in the respective quarterly reports.

mg/L - milligrams per liter

µg/L - micrograms per liter

NA - Not analyzed

MBAS - Methylene Blue Active Substances

TPH - Total petroleum hydrocarbons

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

NA - Not analyzed

ND - Not detected

PAHs - Polycyclic aromatic hydrocarbons

OCPs - Organochlorine pesticides

PCBs - Polychlorinated biphenyls

VOCs - Volatile organic compounds

SVOCs - Semi-volatile organic compounds

MTBE - Methyl tert-butyl ether

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - This sample was labeled LFE-GW on the chain of custody and was reported by the laboratory as LFE-GW. This sample ID (LFE-GW) has been changed within the text, tables, and database to reflect the historical name of this seep (DAESP03).

3 - This sample was labeled LFE-GWD on the chain of custody and was reported by the laboratory as LFE-GWD. In accordance with the QAPP, this sample ID (LFE-GWD) was changed to DUP112801 within the text, tables, and database.

4 - Dissolved metals were analyzed by the quality control laboratory using method E200.7 on an Inductively Coupled Plasma (ICP) instrument. The primary laboratory analyzed dissolved metals by EPA Method 6020 on an ICP/Mass Spectrometry (ICP/MS) instrument. Although variability between these two methods is not expected, the variability in the data may be a result of different analytical methods used.

µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

	06/02/03	Not flowing	--	--	Surface

Notes

1 - All depth to water measurements are an average of three measurements recorded in the field.

2 - The limited amount of water observed within this well most likely represents water in the end cap not representative of the natural aquifer.

LANDFILL 4
APPENDIX SECTION A-8
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill 4 (LF 4) is located in the west-central portion of the Presidio (Figure 1) between Central Magazine Road and Hitchcock Street. The site elevation ranges from 285 to 325 feet above the PLLW vertical datum (Figure A-8-1).

LF 4 operated between 1946 and 1981 and was used to dispose of debris and fill material. In 1981, Landfill 4 was closed and a 3-foot-thick soil cap was placed over the debris (ANL, 1989). The landfill contained up to 14 vertical feet of debris material, reportedly consisting of a variety of different materials that potentially include chemical wastes from various Presidio facilities. Fill materials also included brick, glassware, gravel, concrete, pipes, battery caps, and plastic (Dames & Moore, 1997). Figure A-8-1 shows the site and the approximate lateral extent of the former landfill.

Two monitoring wells, LF4GW100 and LF4GW101, were installed at the LF 4 site in July and August 2000 by the Trust (Figure A-8-1) to supplement existing monitoring well LF04GW03 (EKI, 2000a). Monitoring wells LF4GW100 and LF4GW101 were completed at 22.5 and 22.8 feet bgs, respectively. Monitoring well LF4GW100 is screened within silt, silty sand, and sand units and extends 0.5 feet into weathered bedrock. Monitoring well LF4GW101 is screened within a clay layer and does not extend into the weathered bedrock. Groundwater was not encountered in either well during or after construction. The occurrence of groundwater in monitoring well LF04GW03 is seasonal; the well does not typically contain adequate groundwater for sampling during the summer months (EKI, 2000a). Additional wells have been installed as part of the remedial action activities discussed in Section 3.0.

Well LF04GW03 has been sampled at irregular intervals from April 1995 to May 1999, which was the last time this well contained sufficient water to sample. Groundwater samples from well LF04GW03 have been analyzed for general chemistry parameters, TPH, metals, and TDS. Summaries of general chemistry, dissolved oxygen, TPH, PAH, chlorinated herbicides, OCP, PCB, VOCs, and metals results for LF 4 groundwater samples are presented in Tables A-8-1 through A-8-3.

2.0 SITE DESCRIPTION AND GEOLOGY

LF 4 is located in the southwestern portion of the Marina Groundwater Basin. Groundwater beneath LF 4 has ranged from approximately 12 to greater than 45 feet bgs. Groundwater flows in a north-northeasterly direction following the general topographic trend (Figures A-8-1 and A-8-2).

As outlined in Section 3.0, following remedial excavation, five new groundwater monitoring wells were installed in the vicinity of former LF 4. Materials encountered while drilling soil borings for installation of monitoring wells LF4GW102 through LF4GW106 generally consisted of dune sand to depths ranging between 6 to 14 feet bgs over silty sand of the Colma Formation to depths between 19 to 46.5 feet bgs. All borings were terminated in Franciscan complex shales and serpentinite to depths ranging between 40 and 48.5 feet bgs. Saturated soils were encountered at approximately 31.5 feet bgs in the boring for LF4GW106 and at a depth of 42.5 feet bgs in the soil boring for LF4GW105.

Well LF4GW102 is located upgradient of the excavated area, near the southern edge of Central Magazine Road (Figure A-8-1). Well LF4GW106 is located within the excavated portion of former LF 4. Wells LF4GW103, LF4GW104, and LF4GW105 are located downgradient of the excavated portion of former LF 4. At wells LF4GW102, LF4GW103, LF4GW104, and LF4GW106, the groundwater surface is located within the Franciscan complex bedrock. At well LF4GW105, the groundwater surface is located near the bottom of the Colma formation, above the Franciscan complex contact (Treadwell & Rollo, 2002e).

3.0 REMEDIAL ACTION

The *Remedial Action Plan and Evaluation of Alternatives (RAP) for Landfill 4 and Fill Site 5* selected excavation, recycling, and offsite disposal of impacted fill material and underlying soil, along with groundwater monitoring, as the remedial alternative for LF 4. The goal of the remediation at LF 4 was to remove all contaminated material, leaving in place soil that meets the established cleanup levels (Treadwell & Rollo, 2002e).

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes and residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to comply with the water quality protection standards or the cleanup levels presented in Section 3 of the RAP for three years.

Between 9 January and 14 February 2003, a total of 14,623 tons (approximately 11,698 yd³) of waste material was removed from former LF 4. The majority of the material (13,551 tons) was disposed as Class I California Hazardous Waste based on soluble lead concentrations. Soil confirmation sample concentrations determined that the majority of site conditions after the removal action meet the goals presented in the RAP (Treadwell & Rollo, 2002e).

Additional soil sampling to complete the soil cleanup activities at LF 4 has been completed and documented in the *Draft Construction Completion Report Landfill 4 and Fill Site 5 (CCR)* (Treadwell & Rollo, 2004f). Between 7 February and 25 April 2003, a total of 12,393 tons of waste material was removed from the former FS 5 site, with an approximate additional 40 cubic yards of Class II waste removed in September 2004. Approximately 90 percent of the fill material was disposed at Class II and Class III disposal sites and the remainder as Class I California Hazardous Waste. Soil confirmation sample concentrations or 95% UCL calculations for all compounds tested (both COC and non-COC compounds) determine that the site soil conditions meet the goals presented in the RAP and that the site is suitable for unrestricted use. Based on the remedial activities conducted, field observations, established cleanup levels, and a review and evaluation of the confirmation sampling results, LF 4 and FS 5 are recommended for construction completion. Groundwater monitoring will continue per the RAP to confirm that applicable cleanup levels are not exceeded (Treadwell & Rollo, 2002e).

Between 19 February and 5 March 2003, approximately 2,970 cubic yards of imported backfill material (Letterman Colma Backfill) was delivered to the site. The Letterman Colma backfill was used to buttress the northern side of Central Magazine Road and contour the slope for erosion control. The source for the LF 4 imported material was the Letterman redevelopment project Colma excavation spoils.

In May 2006, Treadwell & Rollo sampled the imported Letterman Colma Backfill Soil (Colma Fill) at LF 4 for OCPs in accordance with the *Field Sampling Plan to Evaluate Possible Chlordane in Letterman Colma Backfill Soil* dated 28 February 2006. The purpose of the soil sampling was to characterize the Colma Fill at LF 4 for the occurrence of chlordane above site specific soil cleanup levels. The analytical results of this sampling event are presented in the *Results of Colma Fill Sampling, Landfill 4, Fill Site 5, and Girard Street Ramp, Presidio of San Francisco, California* dated 20 February 2007 (Treadwell & Rollo, 2007).

The results of the Colma Fill sampling indicate soil cleanup level exceedances are present in Colma backfill soil at Landfill 4 at concentrations which below human health residential cleanup levels, but that significantly exceed the ecological special-status cleanup levels. The Trust will discuss these exceedances with DTSC to address the potential threat to ecological receptors (Treadwell & Rollo, 2007).

Following the removal action and subsequent soil import, five new monitoring wells (LF4GW102 through LF4GW106) were installed in February 2003 in the locations shown on Figure A-8-1. The new wells were added to the Presidio Quarterly Groundwater Monitoring Program beginning with the First Quarter 2003 and were to be sampled quarterly for a minimum of three years, in accordance with the RAP. Monitoring wells LF04GW03, LF4GW100, and LF4GW101 were to be monitored for the presence of water and sampled when sufficient water is present.

4.0 GROUNDWATER MONITORING

LF 4 has eight monitoring wells (LF04GW03 and LF4GW100 through LF4GW106) associated with the LF 4 groundwater monitoring program (Figure A-8-1). Third and Fourth Quarter 2006 groundwater elevations were collected at all LF 4 monitoring wells on 14 August and 4 December 2006, respectively (Table A-8-4). All LF 4 monitoring wells contained water during both quarters, except for LF4GW101, which was dry during the Fourth Quarter 2006.

Monitoring wells LF4GW103 and LF4GW104 were the only wells proposed for sampling during the Third and Fourth Quarters 2006 (Tables 1A and 1B, respectively).

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 14 August and 4 December 2006 in all LF 4 monitoring wells with the exception of LF4GW101, which was dry during the Fourth Quarter 2006. Groundwater elevations are summarized in Table A-8-4. Water level meters were calibrated on 14 August and 4 December 2006, and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the Third Quarter 2006, the groundwater elevations ranged from 273.79 to 308.16 feet above PLLW in monitoring wells LF4GW105 and LF4GW102, respectively (Figure A-8-1).

During the Fourth Quarter 2006, groundwater elevations ranged from 269.95 to 300.45 feet above PLLW in monitoring wells LF4GW105 and LF4GW102, respectively (Figure A-8-2). LF4GW101 was dry during the Fourth Quarter 2006.

Groundwater gradients were calculated to be approximately 0.10 and 0.11 feet per foot in a northeasterly direction during the Third and Fourth Quarters 2006, respectively. Groundwater gradients observed during the Third and Fourth Quarters 2006 are consistent with previous monitoring events.

4.2 Monitoring Well Purging and Sampling

During the Third Quarter 2006, LF 4 monitoring wells LF4GW103 and LF4GW104 were sampled on 16 August 2006. During the Fourth Quarter 2006, monitoring wells LF4GW103 and LF4GW104 were sampled on 5 December 2006.

Purge equipment, purging volumes, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon aboveground polyethylene storage tank located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used at each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the Third and Fourth Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from LF 4 monitoring wells during the Third Quarter 2006 were analyzed for general chemistry, TDS, PCBs, and 14 dissolved metals. Groundwater samples collected from LF 4 monitoring wells during the Fourth Quarter 2006 were analyzed for general chemistry, TDS, and 14 dissolved metals.

Post-remediation groundwater monitoring requirements from the RAP have been met for TPH, PAHs, VOCs, OCPs, and chlorinated herbicides for the required frequency of monitoring and therefore, these analytical compounds are no longer included in the Groundwater Monitoring Program at Landfill 4.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-8-1. During the Third Quarter 2006, dissolved oxygen was measured at 0.47 and 0.2 mg/L in monitoring wells LF4GW103 and LF4GW104, respectively. During the Fourth Quarter 2006, dissolved oxygen was measured at 0.7 and 0.8 mg/L in monitoring wells LF4GW103 and LF4GW104, respectively. The dissolved oxygen concentrations measured during the Third Quarter 2006 are within the range of concentrations previously measured within Landfill 4 monitoring wells.

5.2 General Chemistry

The majority of the general chemistry parameter results measured during the Third and Fourth Quarters 2006 were within historical ranges.

Nitrate was detected at a high concentration of 0.09 mg/L in monitoring well LF4GW103 during the Third Quarter 2006. This concentration was only slightly higher than historical range and can be attributed to natural fluctuation. The remaining general chemistry results were within historical ranges during the Third and Fourth Quarters 2006.

5.3 PCB Results

PCB results, along with RAP-specified cleanup levels, are presented in Table A-8-2. No PCBs were detected above the laboratory's reporting limit within LF4GW103 or LF4GW104 during the Third Quarter 2006. One PCB (aroclor 1260) was detected above its RAP-specified cleanup level in the LF4GW104 during the Third Quarter 2005. No other PCB detections have occurred in any LF 4 groundwater samples.

5.4 Dissolved Metals Results

Dissolved metals results, along with RAP-specified cleanup levels, are presented in Table A-8-3.

The table below summarizes new high and low dissolved metal analytical results for the Third Quarter and Fourth Quarters 2006 within wells LF4GW103 and LF4GW104 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the commencement date of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
LF4GW103	Arsenic	5 / 16	< 5	6	--	6.2	µg/L
	Copper	7 / 16	< 1	2.3	--	2.6	µg/L
	Manganese	16 / 16	37	170	16	--	µg/L
LF4GW104	Arsenic	2 / 17	< 2 *	3.1	--	5.3	µg/L
	Nickel	8 / 17	< 20	22	--	24	µg/L
	Sodium	17 / 17	4,500	98,000	--	100,000	µg/L

An asterisk (*) indicates qualified data in the above table.

The dissolved metals concentrations listed above were slightly outside of the range of previously reported concentrations and are therefore, not considered to be significant.

Dissolved metals concentrations at Landfill 4 have remained relatively stable in recent quarters. No dissolved metals exceeded the RAP-specified cleanup levels during the Third or Fourth Quarters 2006. However, dissolved nickel exceeded the RAP-specified cleanup level in six of the previous seven quarters within LF4GW103 and it was detected at the cleanup level of 100 µg/L within this well during the Third and Fourth Quarters 2006.

6.0 CONCLUSIONS & RECOMMENDATIONS

No significant trends were observed in the samples collected during the Third and Fourth Quarters 2006. The majority of the general chemistry parameter results measured during the Third and Fourth Quarters 2006 are within historical ranges and appear to be stable. No PCBs

were detected above the laboratory's reporting limit within LF4GW103 or LF4GW104 during the Third Quarter 2006.

Dissolved metals concentrations at Landfill 4 have remained relatively stable in recent quarters. No dissolved metals exceeded the RAP-specified cleanup levels during the Third or Fourth Quarters 2006. However, dissolved nickel was detected at the cleanup level of 100 µg/L within LF4GW103 during both the Third and Fourth Quarters 2006. Nickel has been detected at concentrations above its applicable cleanup level several times within LF4GW103 during recent monitoring events. Therefore, the potential for increasing or decreasing dissolved nickel concentrations within monitoring wells LF4GW103 and LF4GW104 will continue to be evaluated in future monitoring events, in accordance with the RAP.

Notes

mg/L - milligrams per liter

NA - not analyzed

NM - not measured

1 - The identified analytical method(s) are for analyses performed in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Nitrite as N prior to May 2001 analysis includes nitrate as N.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

µg/L - micrograms per liter

NA - not analyzed

ND - not detected

1 - The identified analytical method(s) are for analyses performed in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - USEPA Region IX tap water preliminary remediation goal (PRG).

3 - From Table 7-6 of the Cleanup Levels Document.

4 - The RAP (Treadwell & Rollo, 2002e) does not list a cleanup level for beta-BHC; however, the RAP states that when chemicals are encountered in groundwater and cleanup levels are not listed, the default should be Tap Water PRGs. The Tap Water PRG for beta-BHC

VOC - volatile organic compound

PCBs - polychlorinated biphenyls

TPH - total petroleum hydrocarbons

PAHs - polycyclic aromatic hydrocarbons

PCE - tetrachloroethene

OCPs - organochlorine pesticides

TCE - trichloroethene

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - USEPA Region IX tap water preliminary remediation goal (PRG).

3 - Dissolved metals were analyzed by the quality control laboratory using method E200.7 on an Inductively Coupled Plasma (ICP) instrument.

The primary laboratory analyzed dissolved metals by EPA Method 6020 on an ICP/Mass Spectrometry (ICP/MS) instrument. Although variability between these two methods is not expected, the variability in the data may be a result of different instruments used.

NA - not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

-- - Cleanup criteria not established

µg/L - micrograms per liter

mg/L -milligrams per liter

Notes

1 - All depth to water measurements are an average of three measurements recorded in the field.

2 - Elevation indicates bottom-of-casing elevation.

3 - The well construction details for this well indicate that the bottom of the casing is 22.5' from the ground surface; however, this well also has 2.04' of casing above grade. Therefore, the bottom of casing elevation has been recalculated for this well to be 24.54' from the top of casing elevation.

FILL SITE 5
APPENDIX SECTION A-9
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Fill Site 5 (FS 5) is located in the western portion of the Presidio (Figure 1) between Lincoln Boulevard and Washington Boulevard, adjacent to the World War II Memorial (Figure A-9-1). The FS 5 site is approximately 270 to 320 feet above the PLLW datum.

FS 5 was reportedly used by the Army for the disposal of debris and municipal waste from approximately 1946 to 1981 (Dames & Moore, 1997), although historical aerial photographs indicate that the area was disturbed (non-vegetated) as early as 1935. FS 5 was reportedly used when inclement weather rendered disposal at Landfill 4 difficult. The site was used for disposal of building debris, fill dirt, landscape waste, and municipal waste. However, filling activities at FS 5 may have ceased as early as 1948, when a structure (former Building 1351) was erected.

No groundwater was encountered during the Army's RI activities at FS 5; thus no groundwater monitoring wells were installed (Dames & Moore, 1997). Montgomery Watson installed three wells (1349MW01, 1349MW02, and 1349MW03) in 1995 as part of the Army's investigation at the nearby Building 1349 area. The locations of these wells are shown on Figure A-9-1.

In July 2000, the Trust constructed two new groundwater monitoring wells (LF5GW100 and LF5GW101) in the presumed downgradient groundwater flow direction from FS 5 (Figure A-9-1).

In accordance with the RAP (Treadwell & Rollo, 2002e) and the Building 1349 Site Investigation (SI) (Treadwell & Rollo, 2003d), six new (1349MW100 through 1349MW102 and LF5GW102 through LF5GW104) and one replacement (1349MW03R) groundwater monitoring wells were installed in the vicinity of former FS 5. The original well 1349MW03 was abandoned prior to the beginning of remedial excavation at former FS 5. The FS 5 remedial action and Building 1349 SI are detailed below in Section 3.0 and also in Appendix A, Section A-5. Monitoring wells 1349MW01, 1349MW02, 1349MW03R and 1349MW100 through 1349MW102 are either within the former footprint of FS 5 or upgradient of FS 5 and therefore, these wells are included in the FS 5 groundwater monitoring plan. Conversely, monitoring wells 1349MW103 through 1349MW105 are located on the opposite side, when compared to Fill Site 5, of the topographic high point associated with the Building 1349 Area within the Marina Groundwater Basin (Figure A-9-1). The groundwater flow direction in this area varies from the northeast to the northwest and away from FS 5, therefore, these wells (1349MW103 through 1349MW105) are not included in the FS 5 groundwater monitoring plan.

Since the Second Quarter 2001, all FS 5 and the associated Building 1349 wells, which are within or directly upgradient of the former FS 5 footprint, have been sampled and analyzed for general chemistry parameters, TPH, VOCs, OCPs, PCBs, PAHs, chlorinated herbicides, dissolved metals and TDS. Summaries of previous analytical results are presented in Tables A-9-1 through A-9-7.

2.0 SITE DESCRIPTION AND GEOLOGY

Materials encountered while drilling soil borings for installation of LF5GW103, LF5GW104, and 1349MW03R consisted of clayey to silty sand of the Colma Formation to depths ranging between 7.5 to 13.5 feet bgs over Franciscan complex serpentinite to the maximum explored depths ranging between 23.5 and 36 feet bgs. Materials encountered while drilling soil boring LF5GW102, although similar to the other soil borings, included dune sand from the ground surface to a depth of 5.5 feet bgs, and silty sand Colma Formation to a depth of 26 feet bgs over Franciscan complex serpentine to the maximum depth explored of 40 feet bgs. Saturated soils were encountered at approximately 11 feet bgs in the boring for LF5GW103 to 26 feet bgs in the soil boring for LF5GW102.

Well LF5GW102 is located near the southwestern boundary of the excavated area (Figure A-9-1). Wells LF5GW103 and LF5GW104 are located within the excavated portion of former FS 5 along the western border. In addition, previously existing well 1349MW03, which was located within the footprint of the FS 5 fill material, was abandoned prior to remedial excavation activities and was replaced with well 1349MW03R. The new location was approximately 60 feet south, further within the footprint of the excavated area, in close proximity to an inferred fault (Figure A-9-1). These wells are generally screened within the Franciscan complex serpentinite, as are wells 1349MW100 and 1349MW101.

Surface and groundwater at FS 5 flows in a southwesterly direction towards Baker Beach in the Coastal Bluffs Groundwater Basin. Depth to groundwater beneath FS 5 ranges from 5 to 33 feet bgs (Table A-9-8). All of the wells at FS 5 and monitoring wells 1349MW01, 1349MW02, 1349MW03R and 1349MW100 through 1349MW102 are located in the Coastal Bluffs Groundwater Basin.

Additionally, groundwater elevation measurements from wells 1349MW103 through 1349MW105 indicate that groundwater in this area flows northeasterly to northwesterly within the Marina Groundwater Basin. Monitoring wells 1349MW103 through 1349MW105 are discussed in Section A-5 and will not be discussed further in this section.

3.0 REMEDIAL ACTION

The *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5* (RAP) was prepared and approved during Third Quarter 2002 (Treadwell & Rollo, 2002e). The RAP selected excavation, recycling, and offsite disposal of all fill material and impacted underlying soils, along with groundwater monitoring, as the FS 5 remedial alternative. Under the remedial alternative, all fill material and contaminated soil with constituent concentrations above the cleanup criteria was removed and disposed of offsite at an approved disposal facility. The removal action at FS 5 began in February 2003 and was completed in September 2004.

Additional soil sampling to complete the soil cleanup activities at FS 5 has been completed and documented in the *Draft Construction Completion Report Landfill 4 and Fill Site 5* (CCR) which was submitted for stakeholder review in the Fourth Quarter 2004 (Treadwell & Rollo, 2004f). Between 7 February and 25 April 2003, a total of 12,393 tons of waste material was removed from the former FS 5 site, with an approximate additional 40 cubic yards of Class II waste removed in September 2004. Approximately 90 percent of the fill material was disposed at Class II and Class III disposal sites and the remainder as Class I California Hazardous Waste. Soil confirmation sample concentrations or 95% UCL calculations for all compounds tested (both COC and non-COC compounds) determined that the site soil conditions meet the goals presented in the RAP. Based on the remedial activities conducted, field observations, established cleanup levels, and a review and evaluation of the confirmation sampling results, LF 4 and FS 5 are recommended for construction completion. Groundwater monitoring will continue per the RAP to confirm that applicable cleanup levels are not exceeded (Treadwell & Rollo, 2002f).

During remedial activities at FS 5, an underground storage tank (UST) was discovered, removed, and off-hauled (Figure A-9-1). The details of the UST removal can be found in the *Draft Underground Storage Tank Closure Report Former Building 1351*, which is included as an appendix to the CCR (Treadwell & Rollo, 2004f). Soil confirmation sample concentrations and/or 95% UCL calculations for compounds tested (both COC and non-COC compounds) indicated that the site conditions meet the goals presented in the RAP.

Based on discussions with DTSC on 19 February 2004 and the Trust's letter to DTSC regarding *Landfill 4 and Fill Site 5 Exceedance Follow-up* dated 17 May 2004 (Trust, 2004), the Trust performed additional sampling at FS 5 on 8 July 2004. The purpose of the additional sampling was to confirm the zinc cleanup level exceedance in the duplicate sample DUP031003A. Sample DUP031003A was collected at a depth of 0.5 feet adjacent to sample FS5EX112[0.5] and had a zinc exceedance as well as detectable levels of cadmium and silver. The previous FS5EX112[0.5] sample location was located using the Trust's Trimble GPS unit. Additional confirmation samples (FS5EX162) were collected at 0.5-, 1-, 1.5- and 2-foot depths. Confirmation sample results for FS5EX162[0.5] and duplicate sample DUP070804B (collected at 1-foot bgs), exceeded the cleanup level of 160 µg/kg.

Additional excavation was completed at sample location FS5EX162. This area was excavated to a depth of 1 foot bgs on 1 September 2004 and confirmation soil samples were collected on 2 September 2004 and submitted for zinc analysis. The additional confirmation sample results were all below the zinc cleanup level of 160 mg/kg indicating that the site is available for unrestricted land use. The results of this sampling are detailed in the CCR (Treadwell & Rollo, 2004f).

Between 9 and 23 April 2003, approximately 5,604 cubic yards (yd³) of imported backfill material was delivered to the site. The source for the FS 5 imported material was the Letterman redevelopment project Colma excavation spoils.

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes, residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to comply with the water quality protection standard or the cleanup levels presented in Section 3 of the RAP for three years. A complete table of cleanup levels for compounds in groundwater applicable to the FS 5 monitoring wells is presented in Table 3-11 of the RAP.

Treadwell & Rollo sampled the imported Letterman Colma Backfill Soil (Colma Fill) at Fill Site 5 for OCPs in accordance with the *Field Sampling Plan to Evaluate Possible Chlordane in Letterman Colma Backfill Soil* dated 28 February 2006. The purpose of the soil sampling was to characterize the Colma Fill at Fill Site 5 for the occurrence of chlordane above site specific soil cleanup levels. The analytical results of this sampling event are presented in the *Results of Colma Fill Sampling, Landfill 4, Fill Site 5, and Girard Street Ramp, Presidio of San Francisco, California* dated 20 February 2007 (Treadwell & Rollo, 2007).

At Fill Site 5, the reported results indicate that the Colma Fill does not contain chlordane above the ecological special-status cleanup level of 9 µg/kg nor other OCPs above applicable cleanup levels. Therefore, no additional action is required or recommended at this site (Treadwell & Rollo, 2007).

Following the removal action, four new monitoring wells (1349MW03R and LF5GW102 through LF5GW104) were installed and added to this groundwater monitoring program at locations shown on Figure A-9-1. The new FS 5 wells were first sampled in the Second Quarter 2003 and were to be sampled quarterly for a minimum of three years in accordance with the RAP.

During Phase 1 of the Building 1349 SI (Treadwell & Rollo, 2003d), monitoring well 1349MW100 was installed upgradient of FS 5. Phase 2 of the Building 1349 SI occurred during the FS 5 excavation activities and wells 1349MW101 and 1349MW102 were installed at the upgradient edge of the former FS 5 footprint to provide upgradient groundwater elevation and chemistry information for FS 5 and therefore, the cleanup levels specified in the RAP apply to wells 1349MW101 and 1349MW102.

Building 1349 monitoring wells 1349MW01, 1349MW02 and 1349MW100 are not located within, but are upgradient of the former FS 5 footprint. Therefore, the cleanup levels specified in the RAP do not apply to monitoring wells 1349MW01, 1349MW02 and 1349MW100.

4.0 GROUNDWATER MONITORING

During the Third Quarter 2006, groundwater elevations were measured at five FS 5 monitoring wells (LF5GW100 through LF5GW104) and six Building 1349 Area monitoring wells (1349MW01, 1349MW02, 1349MW03R and 1349MW100 through 1349MW102) associated with the FS 5 groundwater monitoring plan (Figure A-9-1). During the Fourth Quarter 2006, groundwater elevations were not proposed at the five FS 5 monitoring wells (LF5GW100 through LF5GW104), however, they were collected, as proposed, at the six Building 1349 Area monitoring wells (1349MW01, 1349MW02, 1349MW03R and 1349MW100 through 1349MW102) associated with the FS 5 groundwater monitoring plan (Figure A-9-2).

During the Third Quarter 2006, groundwater samples were collected from monitoring wells LF5GW100 through LF5GW104, 1349MW02, 1349MW03R, and 1349MW100 through 1349MW102, in accordance with Table 1A. During the Fourth Quarter 2006, groundwater samples were only collected from monitoring well 1349MW100, in accordance with Table 1B.

FS 5 seep location LF5SP100 was not flowing during the Third Quarter 2006 and, therefore, no samples were collected. Building 1349 monitoring well results are also discussed in Appendix A, Section A-5.

Water level meters were calibrated on 14 August and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected during the Third and Fourth Quarters 2006 on 14 August and 4 December 2006, respectively. During the Third Quarter 2006, Fill Site 5 and associated Building 1349 Area groundwater elevations ranged from 223.12 to 288.88 feet above PLLW in monitoring wells LF5GW100 and 1349MW101, respectively (Figure A-9-1). During the Fourth Quarter 2006, groundwater elevations ranged from 276.25 to 284.14 in monitoring wells 1349MW01 and 1349MW101, respectively (Figure A-9-2). Groundwater elevations are presented in Table A-9-8.

Groundwater elevations at Fill Site 5 were generally higher during the Third Quarter 2006 when compared to the Third Quarter 2005 at FS 5. During the Third Quarter 2006, the groundwater flow direction was generally southwest, towards the Pacific Ocean following the general topographic trend (Figure A-9-1). The Third Quarter 2006 groundwater gradient was approximately 0.13 feet per foot. Groundwater elevations were not collected for FS 5 during the Fourth Quarter 2006. However, based on the data collected at Building 1349 and downgradient

at BBDA 3, the groundwater flow direction was observed to be southwesterly across FS 5 (Figure A-9-2) with a gradient of approximately 0.20 feet/foot. The Third and Fourth Quarters 2006 groundwater elevations and gradients were similar to those observed previously at FS 5. ORP, pH, and temperature measurements were collected as part of the low-flow sampling methodology and are presented in Table A-9-1.

4.2 Monitoring Well Purging and Sampling

The Third Quarter 2006 sampling occurred on 16 and 17 August 2006. The Fourth Quarter 2006 sampling occurred on 5 December 2006. The Third and Fourth Quarter 2006 sampling at FS 5 was conducted in accordance with methods shown in Tables 1A and 1B of the main text and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water general chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon polyethylene AST located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the Third and Fourth Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from FS 5 monitoring wells and associated Building 1349 Area monitoring wells 1349MW03R, and 1349MW100 through 1349MW102 were analyzed for OCPs and/or general chemistry parameters, during the Third Quarter 2006. Groundwater samples collected from monitoring well 1349MW100 were also analyzed for TPHg, TPHd, TPHfo, PAHs, VOCs, PCBs, TDS, general chemistry parameters and 23 dissolved metals, during the Third Quarter 2006.

Groundwater samples collected from monitoring well 1349MW100 were analyzed for TPHg, TPHd, TPHfo, PAHs, OCPs, VOCs, TDS, general chemistry parameters and 23 dissolved metals, during the Fourth Quarter 2006.

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the Presidio QAPP, with a carbon range of C₂₄ to C₃₆. Section 5.4.3.1 in the main text discusses the data compatibility issues associated with TPH analyses.

Analytical results are discussed below.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-9-1. Dissolved oxygen concentrations measured during the Third Quarter 2006 were similar to historical levels and ranged from 0.38 mg/L to 0.81 mg/L in LF5GW100 and 1349MW100, respectively. Dissolved oxygen was mistakenly not collected by the field team at monitoring wells LF5GW102 through LF5GW104, 1349MW03R, or 1349MW101 and 1349MW102. The dissolved oxygen concentration measured in 1349MW100 during the Fourth Quarter 2006 was 1.6 mg/L.

5.2 General Chemistry Results

General chemistry results are presented in Table A-9-1. General chemistry results for the Third and Fourth Quarters 2006 within Building 1349 Area monitoring well 1349MW100 were generally within historical ranges.

Total alkalinity and bicarbonate were measured at new high concentrations of 1,000 mg/L in monitoring well 1349MW100 during the Fourth Quarter 2006. These new high concentrations were only slightly outside of the historical high and can be attributed to natural fluctuation. The remaining general chemistry results were within historical ranges during the Third and Fourth Quarters 2006.

5.3 TPH Results

TPH results are summarized in Table A-9-2 and on Figure A-9-3. During the Third Quarter 2006, only upgradient well 1349MW100 was sampled for TPH analyses. TPHg and TPHd were detected in the 1349MW100 sample at concentrations of 820 and 42,000 µg/L, respectively. During the Fourth Quarter 2005, TPHg and TPHd were detected in FS 5 associated monitoring well 1349MW100 at concentrations of 1,200 and 13,000 µg/L, respectively.

Fill Site 5 RAP-specified cleanup levels do not apply to monitoring well 1349MW100. Building 1349 Area cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

TPHfo was not detected in 1349MW100 groundwater samples during the Third and Fourth Quarters 2006.

5.4 VOC Results

VOCs were only analyzed in samples collected from monitoring well 1349MW100 during the Third and Fourth Quarters 2006 (Table A-9-3). During the Third Quarter 2006, ethylbenzene was not detected above reporting limits for the first time within monitoring well 1349MW100. Ethylbenzene was also not detected during the Fourth Quarter 2006. Benzene was detected in monitoring well 1349MW100 during the Third and Fourth Quarters 2006 at concentrations of 23 and 18 µg/L, respectively. Total xylenes were not detected above laboratory limits during the Third Quarter 2006; however, total xylenes were detected at a concentration of 2.3 µg/L during the Fourth Quarter 2006 in this well.

Fill Site 5 RAP-specified cleanup levels do not apply to monitoring well 1349MW100. Building 1349 Area cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

5.5 OCP and PCB Results

Results of OCP and PCB analyses are presented in Table A-9-4 and beta-BHC and gamma-BHC results are illustrated on Figure A-9-3. PCBs were only analyzed in monitoring well 1349MW100 during the Third Quarter 2006. PCBs have not been detected within any FS 5 or associated Building 1349 Area monitoring well samples to date. OCPs were analyzed within all FS 5 monitoring wells and monitoring wells 1349MW03R and 1349MW100 through 1349MW102 during the Third Quarter 2006 and only in 1349MW100 during the Fourth Quarter 2006. Of these wells, OCPs were only detected within monitoring well 1349MW100 during the Third and Fourth Quarters 2006. Analytical results are discussed below.

Endrin was detected at a new high concentration of 0.7 µg/L during the Third Quarter 2006, which is significantly higher than the previous high concentration of 0.2 µg/L detected in the Second Quarter 2004. Additionally, 4,4'-DDT, gamma-BHC, heptachlor, and heptachlor epoxide were all detected within historical ranges in 1349MW100 during the Third Quarter 2006.

During the Fourth Quarter 2006, 4,4'-DDE, dieldrin, and heptachlor were detected within 1349MW100 at concentrations of 0.3, 0.3 and 0.2 µg/L, respectively.

Fill Site 5 RAP-specified cleanup levels do not apply to 1349MW100; however, Building 1349 Area CAP-specified cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

5.6 PAH Results

Several PAHs were detected within historical ranges in monitoring well 1349MW100 during the Third and/or Fourth Quarters 2006, including acenaphthene, anthracene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, fluoranthene, fluorene, phenanthrene, and pyrene. Analytical results are presented in Table A-9-5.

Fill Site 5 RAP-specified cleanup levels do not apply to monitoring well 1349MW100. Building 1349 Area cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

5.7 Dissolved Metals Results

Monitoring well 1349MW100 was the only well sampled for dissolved metals during the Third and Fourth Quarters 2006. Fill Site 5 RAP-specified cleanup levels do not apply to monitoring well 1349MW100. Building 1349 Area cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

Dissolved metals results are presented in Table A-9-7 and 2006 arsenic, chromium, and iron results are presented on Figure A-9-3. All dissolved metal concentrations detected in 1349MW100 during the Third and Fourth Quarters 2006 were within historical ranges and do not appear to be significant.

6.0 CONCLUSIONS & RECOMMENDATIONS

Groundwater elevations at Fill Site 5 were generally higher during the Third Quarter 2006 when compared to the Third Quarter 2005 at FS 5. Elevations, gradients and flow directions are consistent with historical values and interpretations. Groundwater monitoring well locations and groundwater elevations are illustrated on Figure A-9-1.

Samples collected from Fill Site 5 monitoring wells during the Third Quarter 2006 were analyzed for OCPs. No OCPs were detected within the Fill Site 5 monitoring wells sampled during the Third Quarter 2006.

Dissolved oxygen concentrations measured were within historical ranges.

TPHg, TPHd, several VOCs, OCPs, PAHs, and dissolved metals were detected in the upgradient Building 1349 monitoring well 1349MW100 samples during the Third and Fourth Quarters 2006. Fill Site 5 RAP cleanup levels do not apply to upgradient Building 1349 monitoring wells.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO₃ concentrations (nitrate-NO₃) which are 4.43 times higher than nitrate-N concentrations.

mg/L - milligrams per liter

NA - not analyzed

NM - not measured

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

ORP - Oxidation Reduction Potential

mV - millivolts

°C - degrees centigrade

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.

3 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).

4 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 are located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.

µg/L - micrograms per liter

NA - not analyzed

TPH - total petroleum hydrocarbons

Bold numbers indicate concentrations which exceed cleanup criteria.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).

3 - Monitoring wells 1349MW01, 1349MW02 and 1349MW100 are located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.

-- - cleanup level not established

µg/L - micrograms per liter

ND - not detected

NA - not analyzed

1,2-DCA - 1,2-dichloroethane

VOCs - volatile organic compounds

MTBE - methyl tert-butyl ether

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Bold numbers indicate concentrations which exceed cleanup criteria.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

- 1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
- 2 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).
- 3 - The RAP does not list a cleanup level for beta-BHC; however, the RAP states that when chemicals are encountered in groundwater and cleanup levels are not listed, the default should be Tap Water PRGs. The Tap Water PRG for beta-BHC (HCH-beta) is 0.037 µg/L.
- 4 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 are located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.
- - cleanup level not established
- µg/L - micrograms per liter
- ND - not detected
- NA - not analyzed
- # - The continuing calibration verification (CCV) drifted outside the limits although the average CCV drift was within method requirements.
- OCPs - organochlorine pesticides
- PCBs - polychlorinated biphenyls
- CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
- Bold** numbers indicate detected concentrations which exceed cleanup criteria.
- Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
- Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).

3 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 is located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.

-- - cleanup level not established

Bold numbers indicate concentrations which exceed cleanup criteria.

µg/L - micrograms per liter

ND - not detected

NA - not analyzed

PAHs - polycyclic aromatic hydrocarbons

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results. RAP cleanup levels only apply to dissolved metals concentrations or whatever has been used on other metals tables.

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Results of Army and Trust studies support the hypothesis that dissolved chromium and hexavalent chromium measured in groundwater in upland areas of the Presidio appear to be naturally occurring and derived from serpentinite. Hexavalent chromium was not retained as a COC (Treadwell and Rollo, 2002e).

3 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).

4 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 are located upgradient of Fill Site 5, therefore, the Fill Site 5 cleanup levels do not apply to these wells.

Surface water seep sample LF5SP100 is analyzed for total metals rather than dissolved, in accordance with the approved plan.

Groundwater samples collected from monitoring wells 1349MW03R through LF5GW104 were field filtered and analyzed for dissolved metals.

Bold numbers indicate concentrations which exceed cleanup criteria.

-- - Cleanup criteria not established

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

BUILDING 231/207 AREA
APPENDIX SECTION A-10
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Building 231/207 Area is located in the northeast portion of the Presidio (Figure 1). The site elevation ranges from approximately 10 to 30 feet above PLLW datum.

Building 231 was built in 1950 and operated as an automobile service station for privately owned vehicles (Figure A-10-1). Building 231 was in operation until mid-1995 as an auto shop and tire store that performed a variety of automobile services. Building 228, located within the Building 231/207 Area, operated as a dry cleaner for an unknown period of time between 1950 and 1973 (Dames and Moore, 1995). Building 207 was the exchange service station and has a history of oil, fuel and gasoline station use (Harding ESE, 2003).

Samples have been collected from wells at the Building 231/207 Area since July 1993 and have been analyzed for general chemistry parameters, TPH, VOCs, and 23 dissolved metals. Groundwater samples were collected at some well locations prior to 1993, and the analytical data for that work is available in the RI Report (Dames & Moore, 1997). A summary of analytical results can be found in Tables A-10-1 through A-10-6 in this section.

The Draft Building 231/207 Area Corrective Action Plan (CAP) (MACTEC, 2005b), which documents the evaluation and selection of cleanup alternatives for soil and groundwater contamination at the site has recently been prepared. The CAP is discussed in greater detail in Section 3.0.

The well box elevations of monitoring wells and piezometers 231GW21, 231GW22, 231PZ03, and 231PZ04 were surveyed as part of the Data Gaps Investigation (MACTEC, 2004b). The survey results presented in Table C.1 of the Data Gaps Investigation Report were subsequently determined to be incorrect due to a surveying error. The top of casing elevations presented in this report were not affected by this surveying error and are correct.

To evaluate changing redox conditions, pH, temperature and ORP were added to the program in the First Quarter 2006. The Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California (MACTEC, 2006a), concluded that ORP is a good indicator for evaluating changing redox conditions. The First Quarter 2006 pH, temperature and ORP data are presented in Table A-10-1 and will be used in the ongoing redox evaluations at CAP sites.

2.0 SITE DESCRIPTION AND GEOLOGY

The Building 231/207 Area is in the northeast portion of the Presidio on the border of the Northeastern and Crissy Field Groundwater Areas, both located within the Marina Groundwater Basin (Figure 1). Subsurface materials beneath the Building 231/207 Area consist of artificial debris fill, fine-grained estuarine deposits, and sand deposits. Groundwater studies conducted in the Building 231/207 Area identified three distinct water-bearing zones, designated as the shallow, intermediate, and deep zones. These three sandy water-bearing zones are separated by two less permeable clayey fine grained estuarine deposits (Harding ESE, 2003). The shallow zone exhibits unconfined conditions and extends to approximately 15 feet bgs. The intermediate zone is semi-confined and extends from approximately 15 to 25 feet bgs. The deep, confined zone extends from approximately 25 to 85 feet bgs. Groundwater flows northward towards the San Francisco Bay (Figures A-10-2 through A-10-5).

3.0 BUILDING 207/231 AREA CAP

The CAP (MACTEC, 2005b) was submitted to all stakeholders for public review on 15 July 2005. The following chemicals were identified by the CAP as chemicals of concern in soil: TPHg, TPHd, TPHfo, VOCs (BTEX, MTBE, PCE, TCE, bromobenzene, vinyl chloride, and methylene chloride), PAHs (acenaphthylene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, fluoranthene, phenanthrene, and pyrene), metals (arsenic, chromium, cobalt, lead, mercury, nickel, silver, and zinc), pesticides (4,4'-DDD), and PCBs (Arochlor 1016). Additionally, the following chemicals were identified by the CAP as chemicals of concern in groundwater; TPHg, TPHd, TPHfo, VOCs (BTEX, MTBE, bromobenzene, 1,2-DCA, PCE, TCE, and vinyl chloride), PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(b)fluoranthene, benzo(k)fluoranthene, and chrysene, and indeno(1,2,3-cd)pyrene), metals (arsenic, lead, nickel, vanadium, and zinc), and PCBs (Arochlor 1016).

Based on cleanup level exceedances, five remedial units (RUs) or areas of contamination exceeding cleanup levels were identified, comprising seven areas of petroleum-related soil contamination and four areas of groundwater contamination.

The CAP recommends *Excavation and Offsite Disposal of Soil, and Groundwater Monitoring* as the preferred corrective action alternative for all RUs except the Historic Building 228 Area. The CAP recommends *Capping, Land Use Controls, In Situ Groundwater Treatment, and Groundwater Monitoring* as the preferred corrective action alternative for Historic Building 228 Area. This corrective action will be implemented by summer 2007 (MACTEC, 2005b).

Groundwater sampling at the Building 207/231 Area will be conducted in accordance with the CAP following CAP approval and implementation. Current and historical groundwater sampling

results are summarized in Table A-10-1 through A-10-6. Cleanup levels proposed in the CAP are presented in Tables A-10-2, A-10-3 and A-10-6.

4.0 GROUNDWATER MONITORING

During the Third and Fourth Quarters 2006, all 27 Building 231/207 Area groundwater monitoring wells and piezometers were measured for groundwater elevations. Monitoring wells associated with the Building 231/207 Area are screened within three distinct water-bearing units designated as the shallow, intermediate, and deep zones.

Only one monitoring well (231GW09) was proposed for sampling at the Building 231/207 Area during the Third and Fourth Quarters 2006. Beginning with the Second Quarter 2003, the sampling frequency and analytical suite for monitoring well 231GW09 was modified to serve as a downgradient well for Fill Site 6A (Tables 1A and 1B). This well was sampled as part of the Fill Site 6A monitoring program described in Appendix A, Section A-3.

Water-level meters were calibrated on 14 August 2006 and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected during the Third and Fourth Quarters 2006 on 14 August and 4 December 2006, respectively. Groundwater elevations are presented in Table A-10-7.

During the Third Quarter 2006, shallow zone groundwater elevations ranged from 5.10 to 10.81 feet above PLLW in monitoring wells 231GW16 and 231GW09, respectively (Figure A-10-2). Intermediate zone groundwater elevations ranged from 5.67 feet above PLLW in monitoring well 207GW03 to 9.57 feet above PLLW in monitoring wells 231GW18 and 231GW27 (Figure A-10-4). Deep zone groundwater elevations ranged from 10.89 feet above PLLW in monitoring well 231GW13 to 11.03 feet above PLLW in piezometer OW-1 (Figure A-10-6).

During the Fourth Quarter 2006, shallow zone groundwater elevations ranged from 5.17 to 10.93 feet above PLLW in monitoring wells 231GW16 and 231GW09, respectively (Figure A-10-3). Intermediate zone groundwater elevations ranged from 5.77 to 9.78 feet above PLLW in monitoring wells 207GW03 and 231GW27, respectively (Figure A-10-5). Deep zone groundwater elevations ranged from 10.90 to 11.05 feet above PLLW in piezometer OW-1 (Figure A-10-7).

Groundwater elevation measurements at the Building 231/207 Area shallow monitoring wells were evaluated with measurements collected at Building 1065/1027 and Fill Site 6 shallow

monitoring wells to better understand groundwater flow directions and gradients in this area. Groundwater elevation data for these adjacent sites can be found in Tables A-11-7 and A-3-6. During the Third and Fourth Quarters 2006, the shallow aquifer groundwater flow direction in the Building 231/207 Area was generally north-northwesterly towards the San Francisco Bay following the general topographic trend (Figures A-10-2 and A-10-3). The shallow groundwater gradient in the vicinity of Building 231 was approximately 0.009 feet per foot during both the Third and Fourth Quarters 2006. Groundwater gradients and flow directions are consistent with previous findings at the site.

Groundwater elevation measurements at the Building 231/207 intermediate aquifer monitoring wells were evaluated with Building 1065/1027 intermediate aquifer monitoring wells to better understand groundwater flow direction and gradient in the intermediate aquifer. These groundwater level data can be found in Tables A-10-7 and A-11-7. During the Third and Fourth Quarters 2006, the intermediate aquifer groundwater flow direction in the Building 231/207 and Building 1065/1027 Areas was generally north, towards the San Francisco Bay following the general topographic trend (Figures A-10-4 and A-10-5). However, a slight depression in the potentiometric surface was present east of Building 231. During the Third and Fourth Quarters 2006, the average intermediate groundwater gradient was calculated in the vicinity of Building 231 to be approximately 0.005 and 0.004 feet per foot, respectively. Groundwater gradients and flow directions are consistent with previous findings at the site.

The groundwater flow direction in the deep aquifer was generally north towards San Francisco Bay during both the Third and Fourth Quarters 2006 (Figures A-10-6 and A-10-7). The groundwater gradient within the deep aquifer was calculated to be approximately 0.0006 feet per foot and 0.0005 feet per foot during the Third and Fourth Quarters 2006, respectively. The deep groundwater flow direction has typically ranged from northeasterly to northwesterly since 2001. Building 231/207 Area vertical gradient estimates are presented in Table A-10-8.

Vertical groundwater gradients were calculated for four well clusters, WC-1, WC-2, WC-3, and WC-4. Clusters WC-1, WC-2, and WC-3 each have piezometers screened within the three distinct water-bearing zones. Cluster WC-4 has piezometers screened within the shallow and intermediate water-bearing zones. A description of which piezometers are contained in each well cluster can be found in Table A-10-8. Upward vertical gradients were present between all groundwater zones at well clusters WC-1, WC-2, WC-3, during the Third and Fourth Quarters 2006. An upward and downward vertical gradient was present at well cluster WC-4 during the Third and Fourth Quarters 2006, respectively. Both upward and downward vertical gradients have historically been measured in well cluster WC-4.

During the Third and Fourth Quarters 2006, Building 231/207 Area groundwater elevations within monitoring wells and piezometers were generally within the range of historical elevations measured at the site. The overall groundwater flow direction and gradients associated with the Building 231/207 Area are consistent with previous events.

4.2 Monitoring Well Purging and Sampling

Groundwater samples were only collected from monitoring well 231GW09 during the Third and Fourth Quarters 2006, in accordance with Tables 1A and 1B of the main text and procedures described in the FSP (Treadwell & Rollo, 2001a). Monitoring well 231GW09 was sampled on 15 August and 5 December 2006 during the Third and Fourth Quarters 2006, respectively.

Purge equipment, purging volumes, purge water general chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the Third and Fourth Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from the Building 231/207 Area monitoring well 231GW09 were analyzed for TPHg, TPHd, TPHfo, VOCs/MTBE, TDS, sulfide, general chemistry parameters, and 23 dissolved metals, during the Third and Fourth Quarters 2006.

The following sections discuss analytical results collected from monitoring well 231GW09 during the Third and Fourth Quarters 2006.

5.1 Dissolved Oxygen

Dissolved oxygen was measured in monitoring well 231GW09 at concentrations of 0.51 and 0.67 mg/L during the Third Quarter and Fourth Quarters 2006, respectively. Both concentrations are within historical ranges. Dissolved oxygen results are presented in Table A-10-2.

5.2 General Chemistry Results

The general chemistry parameter results measured at 231GW09 during the Third and Fourth Quarters 2006 are within historical ranges. General chemistry results are presented in Table A-10-1.

5.3 TPH Results

As shown in Table A-10-2 and on Figure A-10-8, no TPH compounds were detected within monitoring well 231GW09 during either the Third or Fourth Quarters 2006.

TPHfo was detected at 231GW09 for the first time in the Second Quarter 2002 at a concentration of 610 µg/L, in exceedance of the RAP cleanup level of 443 µg/L. TPHfo has not been detected since, and therefore this detection can be considered an anomaly.

TPH_g and TPH_d have not exceeded RAP cleanup levels to date within 231GW09 monitoring well samples.

5.4 VOC, BTEX, and MTBE Results

As shown in Table A-10-3 and on Figure A-10-8, no VOC compounds (including BTEX and MTBE) were detected during either the Third or Fourth Quarters 2006 within 231GW09.

5.5 Dissolved Metals and TDS Results

Dissolved metals results are presented in Table A-10-6. Monitoring well 231GW09 was proposed and sampled for 23 dissolved metals analysis during the Third and Fourth Quarters 2006.

Chromium was detected at a new high concentration of 30 µg/L in the QC duplicate collected from monitoring well 231GW09 during the Fourth Quarter 2006. This new high concentration was only slightly outside of the historical high and can be attributed to natural fluctuation.

Nickel was detected at 18 µg/L, within historical ranges but above its CAP-specified cleanup level of 8.2 µg/L within the QC duplicate sample collected from 231GW09 during the Third and Fourth Quarters 2006.

As shown in Table A-10-6, the remaining dissolved metal results were within historical ranges during the Third and Fourth Quarters 2006.

6.0 GROUNDWATER REDOX PARAMETERS

Several parameters were measured in the field and in the laboratory to help determine the redox state of groundwater at the Building 231/207 Area.

The Trust has currently preparing a *Technical Memorandum: Arsenic and Other Metals in Groundwater at Three Corrective Action Sites, Presidio of San Francisco, California* (MACTEC, 2006a). This technical memorandum discusses the reduction/oxidation (redox) state of groundwater at the Building 231/207 Area using data collected as part of the Presidio-wide Groundwater Monitoring Program. Groundwater redox parameter results collected during the

Third and Fourth Quarters 2006 were generally within the range of previously detected concentrations at the Building 231/207 Area.

Building 231/207 Area monitoring well 231GW09 was included with the modified redox diagrams developed for associated Fill Site 6 monitoring wells. The redox diagrams were generated using the Sequence™ program and concentrations of dissolved oxygen, nitrate, manganese, iron, sulfate and methane and are plotted on Figure A-10-9. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring well location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment.

7.0 CONCLUSIONS & RECOMMENDATIONS

Building 231/207 Area monitoring well 231MW09 was purged and sampled during the Third and Fourth Quarter 2006 and was the only Building 231/207 monitoring well scheduled for sampling during these events. No TPH or VOC compounds were detected at or above their laboratory reporting limits.

The majority of detected analytes were within historical bounds during the Third and Fourth Quarters 2006. Dissolved nickel was detected at 231GW09 above its CAP-specified cleanup level during both the Third and Fourth Quarters 2006. However, both of these detections were within historical ranges. No other CAP-specified cleanup levels were exceeded during either the Third or Fourth Quarters 2006. There are no proposed changes to the groundwater sampling schedule or procedures at this site.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

mg/L - milligrams per liter

°C - degree centigrade

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

mV - millivolts

NR - Not Reported

ORP - oxidation Reduction Potential

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

- The identified analytical method(s) are for analyses performed beginning in the Second Quarter 200 during previous quarters are identified in the respective quarterly reports.
 - From Table 4 of the CAP.
 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.
- µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
NM - Not measured
TPH - Total petroleum hydrocarbons
g - Hydrocarbon reported in the gasoline range does not match the gasoline standard.
H - Heavier hydrocarbons contributed to the quantitation.
L - Lighter hydrocarbons contributed to the quantitation.
ndp - Hydrocarbon reported does not match the pattern of the diesel standard.
NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
Y - Sample exhibits a fuel pattern that does not resemble the standard
Z - Sample exhibits unknown single peak or peaks.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
Bold numbers - indicate concentrations which exceed cleanup levels.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - From Table 4 of the CAP.

3 - These analytes were mistakenly not marked on the chain-of-custody by the field team during this sampling event.

µg/L - micrograms per liter

NA - Not analyzed

ND - Not detected

VOC - Volatile organic compound

1,3,5-TMB - 1,3,5-trimethylbenzene

1,2,4-TMB - 1,2,4-trimethylbenzene

1,2-DCA - 1,2-dichloroethane

MTBE - methyl tertiary-butyl ether

TCE - trichloroethene

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Bold numbers - indicate concentrations which exceed cleanup levels.

-- Cleanup level not established.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Fourth Quarter 2004.

mg/L - milligrams per liter

TOC - Total Organic Carbon

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration. As III has been detected at greater concentrations than inorganic As, due to analytical variability. As V is reported as non-detect when As III is detected at a greater concentration than inorganic As.

2 - From Table 4 of the CAP.

µg/L - micrograms per liter

Bold numbers indicate concentrations which exceed cleanup levels.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the First Quarter 2005.

2 - From Table 4 of the CAP.

3 - Due to computer/review error by the laboratory, sample 231GW09 was not analyzed by ICP-MS for the list of 22 metals. The sample had already been disposed of when the omission was discovered.

4 - Additional metals were analyzed as part of Fill Site 6 and are presented in Table A-3-3.

The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historic data qualifiers.

Bold numbers - indicate concentrations which exceed cleanup levels.

-- Cleanup level not established.

Notes

1 - All depth to water measurements are an average of three measurements recorded in the field.

2 - The depth to water was improperly recorded as 2.31 feet rather than 12.31 feet on 26 November 2001.

3 - This depth to water was measured on 6 December 2002. The depth to water measured on 2 December 2002 (2.27 feet) was determined to be in error.

MW- Monitoring well

PZ - Piezometer

NS - Not Surveyed

feet PLLW - feet above Presidio Lower Low Water vertical datum

	231GW26	03/10/03	Intermediate	9.8	-1.99			

Notes

NC - not calculated

1 - Vertical gradients are calculated by dividing the distance in groundwater elevations between two adjacent wells screened in separate water-bearing zones by the vertical between the midpoint elevations of the two well screens (Table 3). In each case, the value for the shallower well is subtracted from that of the deeper well. A positive value indicates a downward vertical gradient, while a negative number indicates an upward vertical gradient.

Third Quarter 2006

Fourth Quarter 2006

BUILDING 1065/1027 AREA
APPENDIX SECTION A-11
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Building 1065/1027 Area is located in the northeastern portion of the Presidio (Figure 1), between Gorgas Avenue to the north, General Kennedy Avenue to the east, Edie Road to the south, and a parking lot to the west. The site elevation ranges from approximately 13 to 26 feet above the PLLW datum (Montgomery Watson, 1997a).

The Building 1065/1027 Area consists of Buildings 1027, 1040, 1047, 1062, 1063, the former location of Building 1065, and areas near these buildings (Figure A-11-1). Building operations formerly associated with the Building 1065/1027 Area include a power house/steam plant, laundry, warehouse, exchange service station, post exchange auto shed/maintenance/paint shop, and a garage (Montgomery Watson, 1997a). A gas station shown on a 1921 map was also identified at a location just south of Building 1040 (Army, 1921).

Building 1027 formerly had a 10,000-gallon fuel oil underground storage tank (UST), which was removed in 1993. Following the tank removal, approximately 170 cubic yards of soil were removed and confirmation samples were collected. The analytical results of the confirmation samples indicated that TPHd was present in the soil at concentrations of 1.4 and 1.6 milligrams per kilogram (mg/kg). BTEX compounds were not detected in any soil confirmation samples (Montgomery Watson, 1996b).

During five sampling events conducted prior to May 1996, TPH was not detected in monitoring wells 1027MW01 and 1027MW03. Therefore, since May 1996, these wells have been used for groundwater elevation monitoring only. Beginning in September 1997, groundwater samples collected from the other site wells have been analyzed for TPH, BTEX, iron, manganese, general water chemistry, and natural attenuation parameters. Dissolved metals, general water chemistry, and natural attenuation parameters were eliminated from the groundwater monitoring program for the Building 1065/1027 Area in May 1999.

Summaries of dissolved oxygen, TPH, BTEX, MTBE, and dissolved metals results are presented in Tables A-11-1 through A-11-4.

An Interim Action Plan was prepared (MACTEC, 2003b) and was implemented by the Trust in November 2003. The interim action consisted of excavating and disposing of approximately 5,582 tons of petroleum impacted soil to Class II and Class III landfills for disposal. The extent

of the excavation was approximately 100 by 130 feet and ranged in depth from 8 to 12 feet (Figure A-11-1).

To evaluate changing redox conditions, pH, temperature and ORP were added to the program in the First Quarter 2006. The *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006a), concluded that ORP is a good indicator for evaluating changing redox conditions. The First Quarter 2006 pH, temperature and ORP data are presented in Table A-11-1 and will be used in the ongoing redox evaluations at CAP sites.

The planned installation of a recycled water treatment and distribution system at the site is currently on hold.

2.0 SITE DESCRIPTION AND GEOLOGY

The Building 1065/1027 Area is located in the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Results of a previous site investigation conducted at the Building 1065/1027 Area indicate that units, which had previously been identified as the shallow/intermediate, intermediate, and deep groundwater zones, appear to be in hydraulic connection. These units are therefore considered to be one hydrogeologic unit called the intermediate groundwater zone. Data presented in the *Interim Data Report, Building 1065 Area* indicate that there does not appear to be a continuous aquitard separating the shallow/intermediate sand and intermediate sand or an aquitard separating what was formerly identified as the “intermediate” and “deep” sand units (now referred to as “upper intermediate sand” and “lower intermediate sand”) (MACTEC, 2003a).

The shallow groundwater zone consists of saturated portions of the fill and, where present, the shallow sand. The intermediate zone consists of the intermediate/shallow sand, upper intermediate sand and lower intermediate sand (identified in previous reports as deep sand). Groundwater levels within wells screened in the intermediate sand unit indicate that it is confined to semi-confined. Comparison of water levels in adjacent shallow zone and intermediate zone well pairs shows that there is an upward vertical gradient between the intermediate and shallow groundwater zones in the northern and central portions of the site (MACTEC, 2003a). The shallow zone extends from approximately 6 to 12 feet bgs, and the intermediate zone extends from approximately 17 to 29 feet bgs. The depth of the deep zone was not defined during the Site Investigation (SI) conducted in 1997 (IT, 1997b). Groundwater flow follows the general northward topographic trend towards the San Francisco Bay (Figures A-11-2 through A-11-5).

Subsurface materials beneath the Building 1065/1027 Area consist of artificial fill, clayey silty sands, clayey silt, and sand. Building 1027 is underlain by silty sand to an approximate depth of 15 feet bgs. A brown, medium dense clayey sand is located beneath the silty sand (Montgomery Watson, 1996b). Fill material within the Building 1065/1027 Area ranges from 1 to 5.5 feet in

thickness. The fill is underlain by native clayey silty sand with an average thickness of 3 feet. The clayey silty sand is underlain by a 9-foot-thick clayey silt (Bay Mud) deposit. Beneath the Bay Mud, a sand layer is present to a depth of approximately 25 feet bgs in some areas and is underlain by a second layer of Bay Mud to depths of approximately 29 feet bgs. Dense sands underlie the second Bay Mud horizon (IT, 1997b, MACTEC, 2003a).

4.0 CORRECTIVE ACTION PLAN BUILDING 1065 AREA

The *Final Corrective Action Plan, Building 1065 Area* (CAP) (MACTEC, 2007) was submitted to all stakeholders for public review on 24 January 2007. The following chemicals were identified by the CAP as chemicals of concern in soil: TPHg, TPHd, TPHfo, VOCs (benzene, ethylbenzene, 2-hexanone, and toluene), PAHs (benzo(a)pyrene), and metals (arsenic, cadmium, lead and zinc). Additionally, the following chemicals were identified by the CAP as chemicals of concern in groundwater: TPHg, benzene, and arsenic.

Based on cleanup level exceedances, three Soil Remedial Units (RUs), Soil RUs A, B, and C, and one Groundwater RU, RU A, were identified in the CAP. The Soil RUs are described in more detail in the CAP. The Groundwater RU in the same location as Soil RU A and is believed to be associated with Soil RU A, therefore, these two RUs have been combined. The Groundwater RU A is comprised of shallow groundwater between 6 and 12 feet bgs beneath and adjacent to the south wall of Building 1063. The groundwater in this area contains TPHg and benzene above their applicable CAP cleanup levels (MACTEC, 2007).

The CAP recommends *Excavation and Offsite Disposal of Soil, Application of In Situ Oxygen Release Product as Necessary, Groundwater Monitoring* as the preferred corrective action alternative for Soil and Groundwater RU A.

Groundwater sampling at the Building 1065 Area will be conducted in accordance with the CAP following CAP approval and implementation. Cleanup levels proposed in the CAP are presented in Tables A-11-3 and A-11-6.

5.0 GROUNDWATER MONITORING

During the Third and Fourth Quarters 2006, 25 Building 1065/1027 Area monitoring wells and piezometers (Figure A-11-1) were measured for groundwater elevations.

During the Third and Fourth Quarters 2006 groundwater samples were collected from monitoring wells 1065MW9A, 1065MW9B, 1065MW101, 1065MW102, and 1047MW101 and piezometers 1065PZ1A, 1065PZ1B, 1065PZ2A, 1065PZ4A and 1065PZ5AR, in accordance with Tables 1A and 1B.

Water level meters were calibrated on 14 August and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

5.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected during the Third and Fourth Quarters on 14 August and 4 December 2006, respectively.

During the Third Quarter 2006, shallow groundwater elevations ranged from 7.34 to 15.52 feet above PLLW in monitoring wells 1065MW101 and 1047MW101, respectively (Figure A-11-2). Intermediate groundwater elevations ranged from 11.87 to 15.15 feet above PLLW in monitoring well 1065PZ4B and piezometer 1065PZ5B, respectively (Figure A-11-4).

During the Fourth Quarter 2006, shallow groundwater elevations ranged from 7.41 to 14.88 feet above PLLW in monitoring wells 1065MW101 and 1047MW101, respectively (Figure A-11-3). Intermediate groundwater elevations ranged from 12.05 to 15.41 feet above PLLW in monitoring well 1065PZ4B and piezometer 1065PZ5B, respectively (Figure A-11-5).

Building 1065/1027 Area shallow aquifer monitoring wells groundwater elevations were evaluated with Building 231/207 and Fill Site 6 shallow monitoring wells to better understand groundwater flow direction and gradients in this area. Monitoring well data for these adjacent sites can be found in Tables A-10-7 and A-3-6, respectively.

During the Third and Fourth Quarters 2006, the shallow aquifer groundwater flow direction in the Building 1065/1027 Area was generally northeast, towards the San Francisco Bay following the general topographic trend (Figures A-11-2 and A-11-3). The Third Quarter 2006 shallow groundwater gradient was calculated to be approximately 0.021 feet per foot. The Fourth Quarter 2006 shallow groundwater gradient was calculated to be approximately 0.014 feet per foot.

Building 1065/1027 Area intermediate aquifer monitoring wells groundwater elevations were evaluated with Building 231/207 intermediate aquifer monitoring wells to better understand groundwater flow direction and gradients in this area. Monitoring well data for the Building 231/207 Area site can be found in Table A-10-3.

During the Third Quarter 2006, the intermediate aquifer groundwater flow direction in the Building 1065/1027 Area was generally to the northwest. During the Fourth Quarter 2006, the intermediate aquifer groundwater flow direction was generally to the northwest, towards the San Francisco Bay following the general topographic trend (Figures A-11-4 and A-11-5). The Third and Fourth Quarter 2006 intermediate groundwater gradients were calculated to be approximately 0.009 and 0.006 feet per foot, respectively. Groundwater gradients and flow directions remain consistent with previous findings at the site. Flow directions and gradients are consistent with previous findings.

5.2 Monitoring Well Purging and Sampling

The Third Quarter 2006 sampling occurred between 15 and 17 August 2006. The Fourth Quarter 2006 sampling occurred between 5 and 7 December 2006. The Third and Fourth Quarter 2006 sampling at the Building 1065/1027 Area was conducted in accordance with methods shown in Tables 1A and 1B of the main text and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water general chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

5.3 Groundwater Analytical Program

The groundwater samples collected during the Third and Fourth Quarters 2006 were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text.

The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this Appendix A subsection.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the Third and Fourth Quarters 2006.

6.0 GROUNDWATER ANALYTICAL RESULTS

Building 1065 Area groundwater samples collected from 1065PZ1A, 1065PZ1B, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A, 1065MW9B, 1065MW101, and 1065MW102 were analyzed for some or all of the following parameters during the Third and Fourth Quarters 2006; general chemistry parameters, TDS, VOCs, MTBE, BTEX, total sulfide, TPHg, TPHd, TPHf, and dissolved metals. Groundwater samples collected from monitoring well 1047MW101 were analyzed for TPHg, TPHss, VOCs and MTBE, during the Third and Fourth Quarters 2006. Specific monitoring wells and piezometer samples were analyzed for parameters detailed in Tables 1A and 1B.

The following sections discuss analytical results collected at the Building 1065/1027 Area during the Third and Fourth Quarters 2006.

6.1 Dissolved Oxygen

Dissolved oxygen was measured in all wells sampled during the Third Quarter 2006 and within all wells sampled in Fourth Quarter 2006, with the exception of 1047MW101. Dissolved oxygen results are presented in Table A-11-1.

During the Third Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.24 mg/L in piezometer 1065PZ2A to 6.53 mg/L at piezometer 1065PZ4A. Dissolved oxygen was measured at new high concentrations of 6.53 mg/L within piezometer 1065PZ4A and 3.81 mg/L within monitoring well 1047MW101, respectively, during the Third Quarter 2006. The detection within piezometer 1065PZ4A was significantly higher than historical concentrations and will be monitored in future quarterly events to assess whether it is an anomalous concentration. The remaining concentrations were only just above the previous high dissolved oxygen concentrations and can be attributed to natural fluctuations. Dissolved oxygen concentrations were within historical ranges for the other Building 1065 Area wells and piezometers during the Third Quarter 2006.

During the Fourth Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.52 mg/L in piezometer 1065PZ2A to 3.80 mg/L in monitoring well 1065MW9B. Dissolved oxygen concentrations were generally within historical ranges for the Fourth Quarter 2006, but new high levels were found at 3.8 and 1.1 mg/L in wells 1065MW9B and 1065MW101, respectively.

6.2 General Chemistry Parameter Results

The majority of the general chemistry parameter results measured during the Third and Fourth Quarters 2006 are within historical ranges. General chemistry results are presented in Table A-11-2.

The following table summarizes new high and low general chemistry analytical results for the Third and Fourth Quarters 2006 within Building 1065 Area monitoring wells and piezometers when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed. Only the new high or new low concentrations are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
1065PZ1B	Alkalinity, Total	18 / 18	230	406	--	440	mg/L
	Bicarbonate	18 / 18	230	406	--	440	mg/L
1065PZ4A	Alkalinity, Total	8 / 8	500	640	440	680	mg/L
	Bicarbonate	15 / 15	364	640	--	680	mg/L
1065MW9A	Fluoride	14 / 18	< 0.3 *	0.18	--	0.19	mg/L
1065MW9B	Alkalinity, Total	9 / 9	240	360	170	--	mg/L

	Sulfate	7 / 7	11	33	8.7	37	mg/L

An asterisk (*) indicates qualified data in the above table.

The majority of the new high and low concentration from the Third and Fourth Quarters 2006 can be attributed to natural fluctuations and are not considered significant. Significant new high and low general chemistry results are discussed below.

During the Third Quarter 2006, total alkalinity and bicarbonate, were detected at concentrations significantly lower than previous concentrations measured in 1065MW9B. Additionally, chloride, nitrate, and sulfate were detected in 1065MW9B at concentrations significantly higher than historically reported in this well. The RPD between the primary and duplicate samples for chloride, nitrate, and sulfate exceeded the 50% criteria specified in the QAPP (Tetra Tech, 2001). However, the effect on the quality of the data due to RPD failure of QC split duplicate samples was not known and therefore data was not qualified by DataVal, as described in the Third Quarter 2006 DataVal report.

General chemistry concentrations will continue to be monitored during future quarterly sampling events to determine if any trends are developing.

6.3 TPH Results

All groundwater samples collected from the Building 1065 Area were analyzed for TPHg, TPHd, and TPHfo during the Third and Fourth Quarter 2006, except for the samples from monitoring well 1047MW101. Monitoring well 1047MW101 was only analyzed for TPHg and TPHss

during the Third and Fourth Quarters 2006, as proposed on Tables 1A and 1B. TPH results are presented in Table A-11-3.

TPHg was detected in piezometer 1065PZ1A during the Third and Fourth Quarters 2006 at concentrations of 230 µg/L and 260 µg/L, respectively, which is within the range of historical concentrations detected in this well.

TPHd was detected in the Third Quarter 2006 for the first time since the Third Quarter 2001 within piezometer 1065PZ4A at 90 µg/L.

Piezometer 1065PZ4A had the only detection and a new high concentration of TPHfo at 390 µg/L during the Third Quarter 2006. TPHfo has not previously been detected in 1065PZ4A. TPHfo concentrations will continue to be monitored to determine if this trend continues.

No TPHg, TPHd and TPHfo concentrations detected were in excess of CAP-specified cleanup levels.

6.4 Dissolved Metals and TDS Results

Dissolved metals results are presented in Table A-11-4. All Building 1065/1027 Area monitoring well and piezometer samples collected were analyzed for the 15 dissolved metals list defined in Tables 1A and 1B during the Third and Fourth Quarters 2006, except for monitoring well 1047MW101 which was not analyzed for dissolved metals during the Third or Fourth Quarter 2006.

The majority of the dissolved metal concentrations measured during the Third and Fourth Quarters 2006 are within historical ranges. The table below summarizes new high and low dissolved metal and TDS analytical results from the Third and Fourth Quarters 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed. Only the new high or new low data are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
1065PZ1B	Potassium	10 / 10	38,000	50,000	35,000	--	µg/L
	Total Dissolved Solids	23 / 23	500	800	--	890	mg/L

	Sodium	9 / 9	47,000	59,000	--	60,800	µg/L
1065MW101	Arsenic	16 / 16	17	30	--	31	µg/L
1065MW102	Calcium	7 / 7	14,000	25,000	--	29,000	µg/L
	Manganese	7 / 7	14	220	--	460	µg/L
	Potassium	7 / 7	2,300	7,800	--	7,900	µg/L
	Total Dissolved Solids	7 / 7	170	560	--	680	mg/L

An asterisk (*) indicates qualified data in the above table.

Significant dissolved metals results are discussed below.

- Dissolved arsenic was detected at concentrations exceeding its CAP-specified cleanup level (10 µg/L) within 1065PZ1A, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A, and 1065MW101 during the Third and/or Fourth Quarters 2006. The dissolved arsenic concentrations detected within 1065MW9A (27 µg/L) and 1065MW101 (31 µg/L) were detected at new high concentrations.
- Copper was detected for the first time in 1065MW9B during the Third Quarter 2006, at a concentration of 1 µg/L. Copper was not detected above laboratory limits within 1065MW9B during the Fourth Quarter 2006.
- Manganese was detected within monitoring well 1065MW102 at a new high concentration of 460 µg/L during the Fourth Quarter 2006. This concentration was over twice as high as the previous high concentration for this location.

During the Fourth Quarter 2006, within monitoring well 1065MW9A, arsenic was detected at concentrations of 27 and 16 µg/L within the primary and QC duplicate samples, respectively. The RPD between the primary and QA/QC split duplicate samples for arsenic exceeded the 50% criteria specified in the QAPP (Tetra Tech, 2001). However, the effect on the quality of the data due to RPD failure of QC split duplicate samples was not known and therefore data was not qualified by DataVal, as described in the Third Quarter 2006 DataVal report.

With the exception of arsenic, no other dissolved metals were detected above CAP-specified cleanup levels for the Building 1065/1027 Area during either the Third or Fourth Quarters 2006.

6.5 VOCs, BTEX and MTBE Results

During the Third and Fourth Quarters 2006, piezometers 1065PZ1A and 1065PZ1B and monitoring wells 1065MW101, 1065MW102 and 1047MW101 were analyzed for VOCs and MTBE. Piezometers 1065PZ2A, 1065PZ4A and 1065PZ5AR and monitoring wells 1065MW9A and 1065MW9B were analyzed for BTEX and MTBE. VOC, BTEX, and MTBE analytical results are presented in Table A-11-3.

The table below summarizes new high and low VOC, BTEX, and MTBE results from the Third and Fourth Quarters 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed. Only the new high or new low data are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
BTEX							
1065MW9B	Toluene	1 / 23	< 0.2	< 0.5	--	0.61	µg/L
	Total Xylenes	1 / 23	< 0.5 *	< 1	--	0.6 *	µg/L
1065MW102	Benzene	1 / 10	< 0.5	< 0.5	--	0.04 *	µg/L
Volatile Organic Compounds							
1065PZ4A	MTBE	2 / 20	< 2	5.9	--	7 *	µg/L
1065PZ5AR	MTBE	2 / 14	< 2 *	3.5 *	--	3.9 *	µg/L
1065MW9B	MTBE	2 / 23	< 0.5	< 2.5	--	3.4 *	µg/L

An asterisk (*) indicates qualified data in the above table.

Significant VOC, BTEX, and MTBE results are discussed below.

During the Third Quarter 2006, benzene was detected (below the typical reporting limit for benzene) for the first time within monitoring well 1065MW102 at a concentration of 0.04 µg/L. The concentration of benzene at monitoring well 1065MW102 is below the CAP-specified cleanup level of 1 µg/L for benzene at the Building 1065 Area.

MTBE was detected at a new high concentration of 3.9 µg/L within piezometer 1065PZ5AR and at 2.3 and 3.4 µg/L in the primary and duplicate samples collected from monitoring well 1065MW9B, respectively. The MTBE concentrations were below the CAP-specified cleanup level of 13 µg/L for MTBE at the Building 1065 Area.

During the Fourth Quarter 2006, toluene and total xylenes were detected in monitoring well 1065MW9B at concentrations of 0.61 and 0.6 µg/L, respectively. The concentrations of

toluene and total xylenes are well below the cleanup level of 150 µg/L for toluene and 1,750 µg/L for total xylenes at the Building 1065 Area. MTBE was detected at a new high concentration of 7 µg/L within piezometer 1065PZ4A. The concentration of MTBE was below the CAP-specified cleanup level of 13 µg/L for MTBE at the Building 1065 Area.

No other VOC, MTBE or BTEX compounds were detected during the Fourth Quarter 2006. VOC, MTBE and BTEX concentrations will continue to be monitored, in accordance with the CAP.

7.0 GROUNDWATER REDOX PARAMETERS

Several parameters were measured in the field and in the laboratory to help determine the redox state of groundwater at the Building 1065 Area.

The Trust has currently preparing a *Technical Memorandum: Arsenic and Other Metals in Groundwater at Three Corrective Action Sites, Presidio of San Francisco, California* (MACTEC, 2006a). This technical memorandum discusses the reduction/oxidation (redox) state of groundwater at the Building 1065 Area using data collected as part of the Presidio-wide Groundwater Monitoring Program. Groundwater redox parameter results collected during the Third and Fourth Quarters 2006 were generally within the range of previously detected concentrations at the Building 1065 Area.

Building 1065 Area monitoring wells and piezometers sampled during the Third and Fourth Quarters 2006 are included with modified redox diagrams developed for this site and the associated Fill Site 6 monitoring wells on Figures A-11-6 and A-11-7, respectively. The redox diagrams were generated using the Sequence™ program and concentrations of dissolved oxygen, nitrate, manganese, iron, sulfate and methane and are plotted on Figures A-11-6 and A-11-7. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring well location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment.

8.0 CONCLUSIONS AND RECOMMENDATIONS

TPHd was detected within piezometer 1065PZ4A in the Third Quarter 2006 at 90 µg/L, for the first time since the Third Quarter 2001, however, no TPHg, TPHd and TPHfo concentrations detected were in excess of CAP-specified cleanup levels.

Dissolved arsenic continues to be detected at concentrations exceeding the CAP-specified cleanup level (10 µg/L) within 1065PZ1A, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A,

and 1065MW101. The dissolved arsenic concentrations detected within 1065MW9A and 1065MW101 were detected at new high concentrations.

Several new high concentrations of MTBE were detected during the Third and Fourth Quarters 2006 within the Building 1065 Area, but the concentrations are all under the CAP-specified cleanup level of 13µg/L for MTBE at the Building 1065 Area.

Groundwater sampling frequency was reduced to annual within all Building 1065/1027 Area wells and piezometers, except 1065PZ1A, 1065PZ1B, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A, 1065MW9B, 1065MW101, 1065MW102, and 1047MW101 until the Building 1065/1027 Area CAP is approved and implemented, at which time the groundwater monitoring program will be conducted in accordance with the CAP.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

mg/L - milligrams per liter

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Cleanup levels taken from Table 6 of the Building 1065 Area CAP (MACTEC, 2005b). The MTBE cleanup level listed is equal to the California Maximum Contaminant Level (EKI, 2002). Total xylenes and TPHg have two different cleanup levels dependent on if the location is inside or outside of the Ecological Buffer Zone. In both cases, the higher cleanup level applies to wells outside of the Ecological Buffer Zone (e.g. the total xylenes cleanup level for wells outside of the Ecological Buffer Zone is 1,750 µg/L, whereas the cleanup level for wells inside the Ecological Buffer Zone is 318 µg/L). Piezometers 1065PZ7A, 1065PZ7B, 1065PZ4A, and 1065PZ4B are the only Building 1065 monitoring locations located inside the Ecological Buffer Zone.

3 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.

4 - Piezometers 1065PZ4A, 1065PZ4B, 1065PZ7A, and 1065PZ7B are located within the Ecological Buffer Zone and therefore, the lower cleanup level applies per the CAP.

-- Cleanup level not established

Bold numbers indicate concentrations that exceed cleanup levels.

µg/L - micrograms per liter

NA - Not analyzed

ND - Not detected

TPH - Total petroleum hydrocarbons

BTEX - Benzene, toluene, ethylbenzene, and total xylenes

MTBE - Methyl tert-butyl ether

H - Heavier hydrocarbons contributed to the quantitation.

L - Lighter hydrocarbons contributed to the quantitation.

Y - Sample exhibits a fuel pattern that does not resemble the standard.

Z - Sample exhibits unknown single peak or peaks.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - From Table 6 of the CAP (MACTEC, 2005b).

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

-- Cleanup level not established

Bold concentrations indicate cleanup level exceedances.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historic data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Fourth Quarter 2004.

mg/L - milligrams per liter

TOC - Total Organic Carbon

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

2 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration.

3 - Relative percentages of As III and As V were calculated by dividing the As III and As V concentrations by the As concentration and multiplying by 100.

4 - From Table 6 of the Building 1065 CAP (MACTEC, 2007)

µg/L - micrograms per liter

-- Cleanup level not established

Bold concentrations indicate cleanup level exceedances.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

MINI-CAP AREAS
APPENDIX SECTION A-12
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Mini-Corrective Action Plans (Mini-CAP) document addresses, individually, the environmental concerns associated with USTs at 13 areas, including 12 buildings and one FDS area at the Presidio. Of the 13 sites listed in the *Mini-CAPs Site Reviews and Recommendations to Address Former Petroleum Release Sites* (Mini-CAP Report) prepared by Geo/Resource Consultants Inc. (GRC) in March 2004, only five are included in the Presidio-wide Groundwater Monitoring Program. The Mini-CAP Areas associated with the Presidio-wide Groundwater Monitoring Program include Buildings 514, 1221, 1213 and 1260 that formerly used USTs for fuel oil heating in residences and offices and gasoline fuel storage for services stations. Additionally, the Mini-CAP Areas also include one section of the former FDS pipelines associated with the Infantry Terrace/Sibert Residential loop (MT-14) (GRC, 2004). Each of the five Mini-CAP Areas included in the groundwater monitoring program are discussed in more detail below.

The five Mini-CAP Areas included in the Presidio-wide monitoring program have been divided into two areas (Area 1 and Area 2), based on location, in order to minimize the number of figures associated with this section and to simplify the reporting. Mini-CAP Area 1 includes Building 1213, Building 1221, and Building 1260 and their locations and groundwater elevation contours are illustrated on Figures A-12-1 and A-12-2. Mini-CAP Area 2 includes Building 514 and FDS Section MT-14. Building 514 is located on the east side of the Tennessee Hollow valley and FDS Section MT-14 is located on the west side of the Tennessee Hollow valley. The site plans, well locations, and groundwater elevation contours associated with Mini-CAP Area 2 are illustrated on Figures A-12-3 and A-12-4.

From 1993 until 1996, Montgomery Watson (MW) removed the USTs and associated piping from 15 buildings that historically used USTs. MW prepared the *Draft Mini-CAPs* in 1999 detailing subsurface investigation results at all 15 sites. In May 1999, International Technologies (IT) Corporation summarized FDS removal activities in the report titled *FDS Closure Report, Presidio of San Francisco, California* (FDS Closure Report). In this report, a CAP was recommended for FDS Sections MT-13 and MT-14. The portion of the FDS associated with MT-14 was subsequently incorporated into the Mini-CAP document.

In March 2003, the Trust requested a review of the Mini-CAP and CAP reports completed by MW and IT Corporation. The Mini-CAP Report recommended additional site investigations and groundwater monitoring for Buildings 514, 1221, 1213, 1260, and the FDS Section MT-14 (GRC, 2004).

In August 2004, GRC installed 11 monitoring wells at the five Mini-CAP Areas. These wells were sampled by GRC for the first time in September 2005 (Third Quarter 2005), but were not added to the Presidio-wide Groundwater Monitoring Program until the Fourth Quarter 2005. Groundwater samples collected from the Mini-CAP wells in September 2005 were analyzed for TPHg, TPHd, TPHfo, VOCs, dissolved metals, PCBs and/or PAHs. The report associated with the September 2005 sampling event is currently being prepared and the associated groundwater analytical data will be presented as part of this groundwater monitoring program upon approval. Groundwater samples collected from mini-CAP wells in the Fourth Quarter 2005 were analyzed for DO, TPHg, TPHd, TPHfo, BTEX, and MTBE (Table A-12-2 through A-12-5).

Cleanup of the Mini-CAP Areas must adhere to Site Cleanup Requirements (SCRs) per *Order No. R2-2003-0080, Revised Site Cleanup Requirements and Rescission of Order No. 91-082 and Order No. 96-070* (RWQCB, 2003). The SCRs are applicable soil and groundwater cleanup levels that protect human health, ecological receptors, and water quality.

1.1 Building 1213

Building 1213 is three story stucco house located in Mini-CAP Area 1 in the western upland portion of the Presidio on Ralston Avenue west of Battery-Howe Wagner (Figure A-12-1). The site elevation is approximately 222 feet above the PLLW datum.

Building 1213 reportedly contained an outdoor 500-gallon fuel oil UST that was removed in 1993. However, the presence of TPHg and benzene above the applicable respective SCRs of 1,030 and 0.6 mg/kg in soil confirmation samples indicated that the UST was used for a gasoline generator. TPHg and benzene were detected in soil confirmation samples at concentrations of 1,500 and 2.8 mg/kg, respectively (GRC, 2004).

In 1999, MW drilled four soil borings 1213SB1 through 1213SB4. Groundwater was not sampled during this investigation. Soil borings, sample locations and chemical data tables, are documented in GRC's 2004 Mini-CAP Report. Soil samples from the borings were analyzed for TPHg, TPHd, BTEX, and VOCs. Of the compounds analyzed, TPHg, benzene, ethylbenzene, and total xylenes were detected at concentrations exceeding their applicable cleanup levels.

GRC installed one monitoring well (1213GW101) at Building 1213 as part of the Mini-CAP, which is currently included in the Presidio-wide Groundwater Monitoring Program.

1.2 Building 1221

Building 1221 is located in Mini-CAP Area 1 in the western upland portion of the Presidio within Fort Winfield Scott (Figure A-12-1) and lies at approximately 224 feet above the PLLW datum.

Four USTs (1221.1, 1221.2, 1221.3, and 1221.4) at Building 1221 were formerly associated with a gasoline service station. The three 6,000-gallon and one 10,000-gallon gasoline USTs were removed between June and September 1993. All the tanks reportedly contained gasoline; however, during removal activities the residual liquid in UST 1221.1 was a mixture of water and waste oil, indicating that the USTs may have been used for automotive waste oil storage.

A total of nine soil confirmation samples were collected from beneath the USTs and were analyzed for TPHg, TPHd, BTEX, and SVOCs. None of these compounds exceeded SCRs. It is unknown if soil was removed from the excavations (GRC, 2004).

In 1999, MW drilled eight exploratory soil and one grab groundwater boring adjacent to and within the former UST excavations. Soil samples were collected and analyzed for TPHg, TPHd, oil and grease, BTEX, and PAHs. PAHs were the only compounds detected above the SCRs. Benzo(a) anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and benzo(k)fluoranthene were all detected at concentrations exceeding their applicable SCRs in soil. Two grab groundwater samples were collected from soil boring 1221HP2 at depths of 10 and 20 feet bgs. Groundwater samples were analyzed for TPHg, oil and grease, BTEX, and VOCs. Compounds detected included benzene, 1,2-DCE, PCE, TCE, and bis(2-ethylhexyl)phthalate. Bis(2-ethylhexyl)phthalate was the only compound detected that exceeded its applicable groundwater cleanup level of 4 µg/L. Detailed results are presented in the Mini-CAP Report (GRC, 2004).

Building 1221's Mini-CAP groundwater monitoring program includes four monitoring wells; 1221GW101, 1221GW102, 1221GW103, and 1221GW104 (Figure A-12-1).

1.3 Building 1260

Building 1260 is located in Mini-CAP Area 1 in the upland area of the Presidio in Fort Winfield Scott within the Special Status Ecological Cleanup Level area (Figure A-12-1). Schofield Avenue is west of the site and Veterans Boulevard (Highway 1) is to the east. The site elevation is approximately 142 feet PLLW (GRC, 2004).

Building 1260 formerly had a 10,000 gallon fuel oil UST that was used in conjunction with a fuel oil pump station. Both Building 1260 and the UST were removed from the site in 1993. Approximately 150 cubic yards of contaminated soil were excavated during the removal (GRC, 2004).

There are three applicable SCRs for Building 1260: recreational human health SCRs, protection of groundwater quality SCRs (>5 feet above the highest groundwater), and Protection of Ecological Receptors SCRs (Table 7-5 EKI, 2002).

Soil samples collected, as part of a subsequent subsurface investigation at the Building 1260 site, were analyzed for TPHd and BTEX compounds. TPHd was detected above the human health SCR of 1,380 mg/kg in two locations at concentrations of 3,100 and 2,300 mg/kg. TPHd was also detected above the ecological receptors SCR of 700 mg/kg at one location at a concentration of 7,100 mg/kg. No other detected compounds were found to exceed applicable SCRs during this investigation.

The groundwater monitoring program at Building 1260 includes monitoring wells 1260GW101, 1260GW102, and 1260GW103 (Figure A-12-1).

1.4 Building 514

Building 514 is located in Mini-CAP Area 2 in the eastern upland portion of the Presidio at the southwest corner of Simonds Loop and Rawles Street (Figure A-12-3). Building 514 is approximately 200 feet above the PLLW datum.

In 1993, a 1,000 gallon fuel oil UST was removed from the site. Following the tank removal, approximately 30 cubic yards of soil were removed and sidewall confirmation samples were collected. Unknown TPH compounds were detected in one soil confirmation sample at a concentration of 3,800 mg/kg. No TPHd, BTEX and SVOCs were detected above laboratory reporting limits. During tank removal activities, no confirmation samples were collected from beneath the former UST; therefore, MW recommended an additional subsurface investigation at Building 514. A soil boring, grab groundwater boring and monitoring well were recommended to further characterize soil and groundwater at the site, but only soil borings were completed during this investigation (GRC, 2004).

In 1994, MW drilled three soil borings 514ASB1 through 514ASB3 to approximately 15 feet bgs. Soil samples were analyzed for TPHd, BTEX, and SVOCs. TPHd, BTEX and SVOCs were not detected above laboratory reporting limits in any of the soil borings.

The groundwater monitoring program for Building 514 includes one monitoring well, 514AGW101 (Figure A-12-3).

1.5 FDS Section MT-14 – Infantry Terrace/Sibert Loop

The Infantry Terrace/Sibert Loop FDS pipeline (Section MT-14) is located in Mini-CAP Area 2 and served residences on both sides of Sibert Loop, entering the area near Building 334, across Sibert Loop and running northeast through the Infantry Terrace area. The residences were served fuel oil through lateral piping extending from a primary pipeline. IT removed or

abandoned in place approximately 1,410 feet of FDS and lateral piping between October 1996 and February 1997. Of the 1,410 feet of piping approximately 699 feet were removed. Due to existing buildings and other features that prevented removal, approximately 711 feet of piping were abandoned in place (GRC, 2004).

During the pipeline removal, overexcavation occurred between Buildings 333 and 334 (59 cubic yards) and also between Buildings 340 and 341 (1,667 cubic yards). The excavations were backfilled with soil treated in the Low Temperature Thermal Desorption (LTTD) unit.

Several confirmation samples collected during the removal action were found to exceed applicable SCRs for either TPH or PAHs. As a result, additional subsurface investigation and monitoring well installation was recommended (GRC, 2004).

The groundwater monitoring program for FDS MT-14 Area consists of two monitoring wells FM14EX07GW101 and FM14EX07GW102 (Figure A-12-3).

2.0 SITE DESCRIPTION AND GEOLOGY

Mini-CAP Areas currently included in the Presidio-wide Groundwater Monitoring Program are described below.

2.1 Building 1213

Building 1213 is situated in the Marina Groundwater Basin. Since Fourth Quarter 2005, the depth to groundwater beneath Building 1213, has ranged between 18 to 30 feet bgs within monitoring well 1213GW101. Groundwater flow in this area has historically followed the general topographic trend towards the east and northeast (Figures A-12-1 and A-12-2).

Regional geology is characterized by unconsolidated deposits consisting of Quaternary slope debris and ravine fill. The unconsolidated sediments are underlain by Franciscan complex bedrock. Based on cross sections by completed by MW in 1999, surface soils (less than 5 feet below grade) are characterized by clayey gravels and clayey sands. Serpentine bedrock is encountered beneath these materials at depths of approximately 23.5 feet (GRC, 2004).

2.2 Building 1221

Building 1221 is in the Marina Groundwater Basin (Figure 1). Since Fourth Quarter 2005, the depth to groundwater beneath Building 1221 has ranged between 7 to 17 feet bgs. Groundwater flow has historically followed the general topographic trend towards the east and northeast (Figures A-12-1 and A-12-2).

Geology at the site is a combination of Quaternary slope debris, ravine fill and Franciscan complex bedrock. Serpentine bedrock from the Franciscan Formation is overlain by unconsolidated dune sand, clays and silty clay deposits (GRC, 2004).

2.3 Building 1260

Building 1260 is located in the West Valley Groundwater Area within the Marina Groundwater Basin. Since Fourth Quarter 2005, the depth the groundwater in Building 1260 monitoring wells has ranged from 7 and 30 feet bgs. Groundwater flow has historically followed the general topographic trend towards the east (Figures A-12-1 and A-12-2).

Regional geology at the Site consists of Franciscan Formation bedrock overlain by unconsolidated deposits of dune sands and clays. In borings completed by MW, clay was observed up to 14 feet bgs and was underlain by serpentine bedrock (GRC, 2004).

2.4 Building 514

Building 514 is located within an uplands area of the Marina Groundwater Basin (Figure 1). Since Fourth Quarter 2005, the depth to groundwater beneath Building 514 has ranged between 20 to 22 feet bgs within monitoring well 514AGW101. Groundwater flow has historically followed the general topographic trend towards the west and northwest (Figures A-12-3 and A-12-4).

Geology at the site consists of the Franciscan complex bedrock to depths of approximately 16 feet bgs overlain by unconsolidated clays and silts (GRC, 2004).

2.5 FDS Section MT-14

FDS Section MT-14 is located in the Marina Groundwater Basin (Figure 1). Since Fourth Quarter 2005, the depth to groundwater has ranged between 23 to 30 feet bgs within site monitoring wells. Groundwater flow has historically followed the general topographic trend towards the east (Figures A-12-3 and A-12-4).

Geology at the site consists of the Franciscan complex bedrock, consisting primarily of sandstone, overlain by undifferentiated slope debris. The surface deposits overlie the bedrock at depths ranging from 1.5 to 17 feet bgs (GRC, 2004).

3.0 GROUNDWATER MONITORING

The Mini-CAP Areas have 11 associated monitoring wells (Figures A-12-1 through A-12-4). Groundwater elevations were collected at all 11 wells in the Third and Fourth Quarters 2006.

All of the Mini-CAP monitoring wells were sampled in accordance with Tables 1A and 1B during the Third and Fourth Quarters 2006, respectively.

Water level meters were calibrated on 14 August and 4 December 2006 for the Third and Fourth Quarters 2006, respectively. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

3.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were manually collected on 4 December and 14 August 2006 at all Mini-CAP monitoring wells and are summarized in Table A-12-5. Mini-CAP wells are located in two separate areas at the Presidio, and groundwater elevation maps are presented for Mini-CAP Area 1 (Figures A-12-1 and A-12-2) and Mini-Cap Area 2 (Figures A-12-3 and A-12-4).

In Mini-CAP Area 1, groundwater elevations during the Third Quarter 2006 ranged from 120.21 to 215.08 feet above PLLW in monitoring wells 1260GW103 and 1221GW101, respectively (Figure A-12-1). Mini-CAP Area 2 groundwater elevations during the Third Quarter 2006 ranged from 147.84 to 181.04 feet above PLLW in monitoring wells FM14EX07GW102 and 514AGW101, respectively (A-12-3). These groundwater elevations are on the west and east sides of the Tennessee Hollow valley, respectively.

Fourth Quarter 2006 groundwater elevations in Mini-CAP Area 1 ranged from 116.19 to 215.00 feet above PLLW in monitoring wells 1260GW103 and 1221GW102, respectively (Figure A-12-2). Mini-CAP Area 2 groundwater elevations during the Fourth Quarter 2006 ranged from 145.99 to 179.94 feet above PLLW in monitoring wells FM14EX07GW102 and 514AGW101, respectively (Figure A-12-4).

In order to better understand groundwater flow directions, data from Mini-CAP Area 1 were evaluated with groundwater elevations from Battery Howe/Wagner wells (Section A-4). Groundwater gradients were calculated for both the northerly and southerly portions of Mini-CAP Area 1. Data from monitoring wells 1213GW101 and BHWGW01 were used for the northern portion and data from monitoring wells 1221GW101 and 1260GW103 were used for the southern portion of Mini-CAP Area 1. Similarly, data from Mini-CAP Area 2 were evaluated with groundwater elevations from adjacent sites (Sections A-6 and A-7). Groundwater gradients in Mini-CAP Area 2 were calculated for the eastern and western portion of the area. Groundwater elevation data for study areas adjacent to Mini-CAP Areas 1 and 2 can be found in Tables A-4-3, A-6-5 and A-7-5, respectively.

Mini-CAP Area 1 groundwater flow directions were northeasterly in the northern portion of the area and easterly in the southern portion of the area, during the Third and Fourth Quarters 2006 (Figures A-12-1 and A-12-2). During the Third Quarter 2006, the groundwater gradient in the northern portion of Mini-CAP Area 1 was approximately 0.06 feet per foot. The groundwater

gradient in the southern portion of Mini-CAP Area 1 was approximately 0.09 feet per foot. Groundwater flow directions and gradients in Mini-CAP Area 1 during the Fourth Quarter 2006 were similar to those observed during the Third Quarter.

Mini-CAP Area 2 groundwater flow direction during the Third Quarter 2006 was generally from the higher elevations of Landfill E, Landfill 2, Fill Site 1 and Building 514, northerly, towards the lower elevation of Tennessee Hollow. During the Third Quarter 2006, the western groundwater gradient was estimated to be approximately 0.11 feet per foot. The eastern groundwater gradient was approximately 0.08 feet per foot. Mini-CAP Area 2 groundwater elevations during the Fourth Quarter 2006 were slightly lower than those observed during the Third Quarter and groundwater flow was northeasterly in the western portion of the site and likely was northwesterly following the topographic trend. However, groundwater gradients could not be estimated because groundwater elevation measurements were not collected from adjacent sites (Tennessee Hollow and Landfill E).

3.2 Monitoring Well Purging and Sampling

In the Third and Fourth Quarters 2006, five of the 11 Mini-CAP monitoring wells were sampled. All Mini-CAP wells were sampled using methods shown in Tables 1A and 1B and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a). In addition to the primary samples collected during the Third Quarter 2006, duplicate sample DUP0816063A and QC duplicate 1213GW101CL were collected from monitoring well 1213GW101, and duplicate sample DUP0815063A was collected from monitoring well 1221GW104. During the Fourth Quarter 2006, duplicate sample DUP1206063A was collected from 1221GW104.

Purge equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this subsection. Purge water was stored, for future disposal, in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

3.3 Groundwater Analytical Program

In the Third Quarter 2006, groundwater samples were collected from five monitoring wells on 15 and 16 August 2006 (FM14EX07GW101, FM14EX07GW102, 1213GW101, 1221GW104, and 514AGW101). These samples were analyzed for various combinations of TPHg, TPHd, TPHfo, BTEX, MTBE, PAHs, general chemistry parameters, and dissolved metals. A groundwater sample from well 1213GW101 was also analyzed for VOCs. Fourth Quarter 2006 groundwater samples were collected from the same five monitoring wells on 5 and 6 December 2006 and were analyzed for the same constituents as the Third Quarter 2006.

All groundwater samples collected during the Third and Fourth Quarters 2006, were submitted to the project laboratory for the analyses shown on Table 1A and Table 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical

method are shown in Table 5. Sample containers used for each well are described in the purge records at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed during the Third and Fourth Quarters 2006.

4.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater analytical results are presented in Table A-12-1 through A-12-4 and are discussed below.

4.1 General Chemistry Results

General chemistry results are presented in Table A-12-1. Samples from wells 1213GW101 and 1221GW104 were analyzed for general chemistry parameters for the first and second times in the Third and Fourth Quarters 2006. General chemistry results will be evaluated once a baseline of data has been established.

4.2 Dissolved Oxygen

Dissolved oxygen results for the Third and Fourth Quarters 2006, are presented in Table A-12-2. Dissolved oxygen meters are calibrated prior to sampling each day.

During the Third Quarter 2006, the concentrations of dissolved oxygen within the Mini-CAP Area monitoring wells ranged from 0.59 mg/L in FM14EX07GW102 to 0.92 mg/L in 514AGW101. Dissolved oxygen was inadvertently not measured within 1221GW104 during the Third Quarter 2006.

During the Fourth Quarter 2006, the concentrations of dissolved oxygen within the Mini-CAP Area monitoring wells ranged from 0.4 mg/L in 1221GW104 to 0.9 mg/L in 1213GW101.

4.3 TPH Results

During the Third and Fourth Quarters 2006, four Mini-CAP monitoring wells (1213GW101, 514AGW101, FM14EX07GW101 and FM14EX07GW102) had groundwater samples analyzed for TPHg, TPHd, and TPHfo. The TPH results are included in Table A-12-2 and detected results are discussed below. For comparison purposes, cleanup levels presented in Table 7-6 of the Cleanup Levels Document have been added to Table A-12-2.

During the Third Quarter 2006, TPHg was detected only in monitoring well 1213GW101. TPHg was detected at concentrations of 150, 340 and 55 µg/L within the primary, duplicate and QC duplicate samples, respectively. The RPD between the duplicate and QC duplicate samples exceeds the 50% criteria specified in the QAPP (Tetra Tech, 2001). However, as described in

the Third Quarter 2006 DataVal report (Appendix D), the data was considered usable and did not require qualification. These detected concentrations were both well below the 770 µg/L cleanup level. TPHd and TPHfo were not detected above laboratory reporting limits during the Third Quarter 2006.

No TPH compounds were detected above laboratory reporting limits during the Fourth Quarter 2006 within any Mini-CAP Area wells sampled.

4.4 BTEX and MTBE Results

In the Third and Fourth Quarters 2006, samples collected from three monitoring wells (514AGW101, FM14EX07GW101 and FM14EX07GW102) were analyzed for BTEX and MTBE by EPA Method 8021B and samples collected from monitoring well 1213GW101 were analyzed for VOCs by EPA Method 8260, in accordance with Tables 1A and 1B. The BTEX, MTBE, and VOC results are presented in Table A-12-2. Cleanup levels presented in Table 7-6 of the Cleanup Levels Document have been added to Table A-12-2 for comparison purposes.

During the Third Quarter 2006, 1,2-dichloroethane and benzene were detected above their associated cleanup levels (Table A-12-2). Benzene was detected in the primary, the duplicate and the QC duplicate samples collected from monitoring well 1213GW101 at concentrations of 24, 36, and 29 µg/L, respectively. 1,2-dichloroethane was detected during the Third Quarter 2006 in the primary, duplicate and QC duplicate samples collected from monitoring well 1213GW101 at concentrations of 6.9, 9.7, and 8.2 µg/L, respectively. The benzene and 1,2-dichloroethane concentrations (36 and 9.7 µg/L, respectively) detected in the duplicate sample from 1213GW101 are the highest concentrations of these analytes detected to date within this well.

Toluene, ethylbenzene and total xylenes were detected above laboratory reporting limits in monitoring well 1213GW101 in the Third Quarter 2006; however, none of these detections were above their associated cleanup levels. Ethylbenzene was detected in the primary, the duplicate and the QC duplicate samples collected from 1213GW101 at concentrations of 1.9, 3.2, and 0.56 µg/L, respectively. The RPD between the duplicate and QC duplicate samples exceeds the 50% criteria specified in the QAPP (Tetra Tech, 2001). However, the data was considered usable and did not require qualification by DataVal, as described in the Third Quarter 2006 DataVal report.

Toluene was detected in the duplicate sample collected from 1213GW101 at a concentration of 0.7 µg/L during the Third Quarter 2006. Toluene was not detected in the primary or the QC duplicate samples collected from this well. Total xylenes were detected in the primary and the duplicate samples collected from 1213GW101 at concentrations of 0.5 and 0.9 µg/L, respectively. Total xylenes were not detected in the QC duplicate above the QC laboratory's reporting limit of 1 µg/L.

No other VOCs (including BTEX compounds) were detected in any groundwater samples analyzed in the Third Quarter 2006.

During the Fourth Quarter 2006, benzene and 1,2-dichloroethane were detected within 1213GW101 at concentrations of 0.8 and 1.3 µg/L, respectively. Both detected concentrations exceed their associated cleanup levels (Table A-12-2). No other VOCs were detected within this well.

MTBE was detected during the Fourth Quarter 2006 within FM14EX07GW101 and FM14EX07GW102 at new high concentrations of 3.3 and 3.1 µg/L, respectively. Both detected concentrations are below the MTBE cleanup level of 13 µg/L. No BTEX compounds were detected within samples from these two wells or 514AGW101 during the Fourth Quarter 2006.

4.5 PAH Results

In the Third and Fourth Quarters 2006, four monitoring wells had samples analyzed for PAHs (Table A-12-3). PAHs were not detected in any samples collected from 1213GW101 or FM14EX07GW102 during either the Third or Fourth Quarters 2006.

Fluoranthene was detected within 514AGW101 at concentrations of 0.03 and 0.07 µg/L during the Third and Fourth Quarters 2006, respectively. Fluoranthene was also detected within FM14EX07GW101 at a concentration of 0.05 µg/L during the Fourth Quarter 2006. No other PAHs were detected within either 514AGW101 or FM14EX07GW101 during either the Third or Fourth Quarters 2006.

4.6 Dissolved Metal Results

During the Third and Fourth Quarters 2006, samples from wells 1213GW101 and 1221GW104 were analyzed for 23 dissolved metals. Dissolved metals results are presented in Table A-12-4.

The tables below summarize new high and low dissolved metal analytical results for the Third and Fourth Quarters 2006 within monitoring wells 1213GW101 and 1221GW104 samples when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed. Only the new high or the new low is shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
1213GW101	Aluminum	1 / 6	< 100	< 100	--	56 *	µg/L
	Arsenic	4 / 6	5.8	6.3	< 5	7.2	µg/L
	Barium	6 / 6	10	11	--	33	µg/L

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
1213GW101	Calcium	6 / 6	19,000	19,000	15,000	19,100	µg/L
	Chromium	6 / 6	23	54	22	75	µg/L
	Copper	1 / 6	< 1	< 1	--	1	µg/L
	Magnesium	6 / 6	71,000	72,000	64,000	88,000	µg/L
	Manganese	4 / 6	< 10	29	--	40	µg/L
	Nickel	1 / 6	< 20	< 20	--	13 *	µg/L
	Potassium	6 / 6	2,500	2,600	560 *	--	µg/L
	Vanadium	1 / 6	< 10	< 10	--	5 *	µg/L
1221GW104	Barium	1 / 5	11	11	< 10	--	µg/L
	Calcium	5 / 5	63,000	63,000	44,000	--	µg/L
	Magnesium	5 / 5	94,000	94,000	81,000	--	µg/L
	Manganese	5 / 5	28	28	13	33	µg/L
	Potassium	5 / 5	2,400	2,400	1,600	--	µg/L
	Sodium	5 / 5	70,000	70,000	60,000 *	--	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and low dissolved metal results are discussed below.

- Aluminum was detected for the first time within the QC duplicate collected from 1213GW101 during the Third Quarter 2006. The detected concentration is lower than the typical reporting limit used by the primary laboratory. Dissolved aluminum concentrations in groundwater are often associated with filter breakthrough; however, the majority of metals concentrations detected within this well are within or below historical ranges.
- Barium was detected at a concentration nearly double the previous high within 1213GW101 during the Fourth Quarter 2006. The detected concentration is significantly below the cleanup level for barium.
- In the Fourth Quarter 2006, chromium was detected in monitoring well 1213GW101 at a new high concentration of 75 µg/L, which exceeds the cleanup level of 50 µg/L. The new high concentration of dissolved chromium detected in monitoring well 1213GW101 during the Fourth Quarter 2006 is only the second detected concentration exceeding the cleanup level of 50 µg/L.

Monitoring well 1213GW101 is screened in serpentinite. Based on the *Technical Memorandum Regarding the Hexavalent Chromium in Serpentinite Bedrock and Groundwater in Upland Areas* (Montgomery Watson, 1999o) and the *Memorandum Regarding the Natural Occurrence of Hexavalent Chromium in Surface Water and Groundwater at the Presidio of San Francisco, California* (EKI, 2000c), hexavalent chromium and dissolved chromium in groundwater in

upland areas of the Presidio can be naturally occurring and derived from serpentinite. There is no known anthropogenic chromium source associated with Building 1213, which would indicate that the dissolved chromium concentrations detected are naturally occurring at Building 1213. However, additional samples should be collected and analyzed during future quarterly monitoring events to determine if this new high detection is anomalous or a new increasing trend.

No other metals were detected above their associated cleanup levels during either the Third or Fourth Quarters 2006.

5.0 CONCLUSIONS & RECOMMENDATIONS

TPHg continues to be detected in monitoring well 1213GW101 at concentrations below its cleanup level. Benzene and 1,2-dichloroethane were detected in monitoring well 1213GW101 at concentrations above their groundwater cleanups during both the Third and Fourth Quarters 2006. Chromium was detected above its cleanup level within 1213GW101 during the Fourth Quarter 2006; though the elevated chromium concentration is thought to be from naturally occurring chromium found in the serpentinite rock in which this well is screened. No other compounds were detected in Mini-CAP groundwater samples above their associated cleanup levels during the Third and Fourth Quarters 2006.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO3 concentrations (nitrate-NO3) which are 4.43 times higher than nitrate-mg/L - milligrams per liter

NA - not analyzed

NM - not measured

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Cleanup levels taken from Table 7-6 in the *Development of Presidio-wide Cleanup Levels for Soil, Sediment, Groundwater, and Surface Water* (EKI, 2002).

-- Cleanup level not established

Bold numbers indicate concentrations that exceed cleanup levels.

mg/L - milligrams per liter

µg/L - micrograms per liter

TPH - Total petroleum hydrocarbons

MTBE - Methyl tert-butyl ether

1,2-DCA - 1,2-Dichloroethane

VOCs - volatile organic compounds

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

NA - Not analyzed

NM - Not measured

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Cleanup levels taken from Table 7-6 in the *Development of Presidio-wide Cleanup Levels for Soil, Sediment, Groundwater, and Surface Water* (EKI, 2002).

-- Cleanup level not established

Bold numbers indicate concentrations that exceed cleanup levels.

µg/L - micrograms per liter

Table 7 in the main report identifies all duplicate and split samples and the well from

Table 11 in the main report identifies current and historical data qualifiers.

Notes:
Groundwater elevation data collected on 14 August 2006.

Groundwater elevations for UBR02GW01 and UBR03GW01 were not used in groundwater contouring.

300GW01 was approved for removal from the groundwater monitoring program prior to the First Quarter 2006.

Landfill E wells DAEGW06 and DAEGW07 were not contoured, due to semi-confined and perched conditions, respectively. Whereas, well DAEGW101 was not contoured because it is screened in a deeper interval.

**NIKE MISSILE FACILITY
APPENDIX SECTION A-13
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California**

1.0 INTRODUCTION AND BACKGROUND

The Nike Missile Facility is located in the southwest portion of the Presidio (Figure 1) and consists of two terraced areas: the Building 1450/1451 area and the Silo/Magazine area (Dames & Moore, 1997). The Building 1450/1451 area is located on the northern, upland portion of the site. The Silo/Magazine area consists of three abandoned underground missile silos located southeast and downhill from the Building 1450/1451 area. Silo/Magazine #1 is on the middle terrace, and Silo/Magazines #2 and #3 are south of Silo/Magazine #1 (Figure A-13-1).

The Nike Missile Facility opened in 1956 and was taken out of service in 1965. Building 1450 functioned as the missile-launch room, the missile-battery maintenance area, an administration office, and living quarters. Building 1451 was used as an operational support and maintenance facility for the Nike Missile Facility. Hydraulic oil, hydraulic oil storage tanks, hydraulic oil equipment, standing water, and debris (including damaged asbestos-containing material, deteriorated lead-based paint, hydrocarbon-affected soil, sludge, and miscellaneous debris) associated with the three missile silos were removed by the International Technology Corporation (IT) between December 1998 and February 1999. In addition to the removal of these hazardous materials, all mechanisms left in place within the silo/magazines were power-washed. The recovered materials and debris were classified and appropriately disposed (IT, 1999).

Since September 1992, monitoring well samples at the Nike Missile Facility site have been analyzed for TPH, PAHs, cyanide, VOCs, and dissolved metals. Analytical result summaries are presented in Tables A-13-1 through A-13-4.

Perchlorate and N-nitrosodimethylamine (NDMA) analyses were performed as part of the Trust's Emergent Chemical Study, requested by the RWQCB, during the First Quarter 2004 within all Nike Missile Facility monitoring wells. The results of the Emergent Chemical Study were detailed in the *Draft Technical Report: Emergent Chemical Study, First Quarter 2004* (Treadwell & Rollo, 2004b) and are briefly summarized in Section 3.0 below.

2.0 SITE DESCRIPTION AND GEOLOGY

The Nike Missile Facility is located in the Lobos Creek Groundwater Basin (Figure 1). Groundwater at the site is generally present between 10 and 40 feet bgs. Groundwater flow at the Nike Missile Facility is reported to follow the general topographic trend towards the south-southeast (Montgomery Watson, 1997a).

Subsurface materials beneath the Nike Missile Facility consist of engineered fill, dune sand, fine-grained deposits of the Colma Formation, and Franciscan Complex bedrock. Engineered fill was imported and graded for construction in the 1950s. Engineered fill is present at the surface and to depths ranging from 10 to 24.5 feet bgs. Beneath the fill, either dune sand or the Colma Formation is present to depths of 20 feet bgs in the northern portion of the site and 42 feet in the south. The Colma Formation is underlain by serpentinite bedrock (Montgomery Watson, 1997a).

3.0 EMERGENT CHEMICAL STUDY

The Trust, at the request of the RWQCB, identified potential source areas for emergent chemical releases and developed a groundwater monitoring plan to address potential source areas at the Presidio. The sampling program was requested by the RWQCB in a letter to the Trust dated 23 June 2003. The emergent chemical groundwater sampling program was developed to determine if past uses at the Presidio resulted in groundwater contamination associated with emergent chemicals identified as perchlorate, NDMA, 1,4-dioxane, 1,2,3-trichloropropane (TCP), hexavalent chromium, and polybrominated diphenyl ether (PBDE).

The Trust transmitted the results of their source area evaluation in a letter to the RWQCB, entitled *Preliminary Evaluation of Potential Emergent Chemical Use Areas and Locations at the Presidio of San Francisco* (Source Evaluation Report), dated 25 November 2003. The potential emergent chemical source areas were evaluated by the Trust considering the following information: 1) the existing environmental data currently contained within the Trust's database; 2) the potential for an emergent chemical or a material containing an emergent chemical to have been used and released in a significant quantity at the Presidio; and 3) locations of sensitive groundwater use areas at the Presidio (Trust, 2003).

Based on the Source Evaluation Report, a follow up groundwater monitoring program concerning potential releases of emergent chemicals at the Presidio was implemented during the First Quarter 2004. NDMA was the only emergent chemical detected above laboratory detection limits during the First Quarter 2004. 1,4-dioxane, perchlorate, and PBDE were not detected above laboratory detection limits within any samples analyzed during the First Quarter 2004 (Treadwell & Rollo, 2004b).

NDMA is a decomposition product of Aerozine 50, a component used in the production of rocket fuel. NDMA has contaminated surface and groundwater at missile and other rocket fuel sites.

NDMA has also been formed through other industrial processes, such as the chlorination of drinking water and the treatment of sewage for wastewater recycling. NDMA is considered by health experts to be a carcinogen (RWQCB, 2003).

The following remedial goals and action levels for NDMA have been established.

- The EPA's Preliminary Remedial Goal (PRG) for tap water is 0.0013 µg/L.
- The California Department of Health Services (CDHS) notification level (formerly action level) for NDMA is 0.01 µg/L.

The Source Evaluation Report identifies the Nike Missile Facility and former Army explosive testing areas as potential NDMA source areas. All Nike Missile Facility monitoring wells had samples collected and analyzed for NDMA during the First Quarter 2004. The discussion below relates to the NDMA sampling which took place during the First Quarter 2004 at the Nike Missile Facility.

Groundwater samples collected from monitoring wells NKGW01 through NKGW05 were analyzed for NDMA by EPA Method 1625 during the First Quarter 2004. NDMA analysis was also completed on the duplicate sample (DUP0317042A) collected from NKGW01.

In 2004, NDMA was detected at concentrations of 0.0048, 0.0016J, 0.0025, and 0.0009J µg/L within NKGW01, DUP0317042A, NKGW04 and NKGW05, respectively. The detected concentrations below the practical quantitation limit of 0.002 µg/L and above the method detection limit of 0.0005 µg/L were estimated and therefore qualified with a 'J'. The Relative Percent Difference (RPD) between the primary and the duplicate samples collected from NKGW01 exceeds the 50% criteria specified in the *Presidio-wide Quality Assurance Project Plan Sampling and Analysis Plan* (QAPP) (Tetra Tech, 2001). However, the data was considered usable and did not require qualification by DataVal, as described in the First Quarter 2004 DataVal report. NDMA was not detected in NKGW02 or NKGW03 samples above laboratory detection limits during the First Quarter 2004. Detection limits and detected concentrations were well below the CDHS action level of 0.01 µg/L. However, the detected concentrations of NDMA within NKGW01 and NKGW04 in the First Quarter 2004 exceeded the EPA's Region 9 Tap Water PRG (0.0013 µg/L).

NDMA was sampled within all Nike Missile Facility monitoring wells during the Third Quarter 2004 and will continue to be sampled within all Nike Missile Facility monitoring wells until the *Remedial Action Plan* (RAP), which is currently being prepared for the Nike Missile Facility, is finalized. A revised groundwater monitoring plan will be implemented at the Nike Missile Facility, in accordance with the RAP when it is approved by the RWQCB and the stakeholders.

4.0 GROUNDWATER MONITORING

The Nike Missile Facility has five associated monitoring wells (Figure A-13-1). Groundwater elevations were collected at all five wells during the Third Quarter 2006. Groundwater elevations were not collected during the Fourth Quarter 2006 as the frequency of water level measurements was reduced to match the sampling frequency at the site. The next groundwater elevations will be collected during the First Quarter 2007.

Groundwater samples were collected at four of the five Nike Missile Facility monitoring wells during the Third Quarter 2006 and analyzed for dissolved oxygen and NDMA, in accordance with the proposed sampling schedule (Table 1A). All five Nike Missile Facility monitoring wells were scheduled to be sampled during the Third Quarter 2006 (Table 1A); however, monitoring well NKGW03 did not have sufficient groundwater for a sample to be collected. No groundwater samples were scheduled for collection during the Fourth Quarter 2006, in accordance with the proposed sampling schedule (Table 1B).

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 14 August 2006 during the Third Quarter 2006. Groundwater elevation maps showing groundwater contours and flow directions for the Nike Missile Facility are included on Figure A-13-1. Water level meters were calibrated on 14 August 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C. Groundwater elevations are presented in Table A-13-5. Groundwater elevations were not measured during the Fourth Quarter 2006.

Groundwater elevations at the Nike Missile Facility during the Third Quarter 2006 ranged from 249.27 to 320.06 feet above PLLW in monitoring wells NKGW01 and NKGW03, respectively (Figure A-13-1). The Third Quarter 2006 groundwater elevations are consistent with historical elevations measured at the site.

During the Third Quarter 2006, groundwater flow was determined to be in a south-southeasterly direction following the general topographic trend. During the Third Quarter 2006, the groundwater gradient was calculated to be approximately 0.11 feet per foot.

4.2 Monitoring Well Purging and Sampling

During the Third Quarter 2006, four of the five Nike Missile Facility monitoring wells (NKGW01, NKGW02, NKGW04, and NKGW05) were purged and sampled on 17 August 2006 in accordance with methods shown in Table 1A and procedures described in the FSP (Treadwell & Rollo, 2001a). Monitoring well NKGW03 was scheduled to be sampled during the Third Quarter 2006, but did not contain enough groundwater for sample collection. No Nike Missile Facility monitoring wells were proposed for sampling during the Fourth Quarter 2006.

Purging equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this section. Dissolved Oxygen meters are calibrated prior to sampling each day. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

In the Third Quarter 2006, groundwater samples were collected from four monitoring wells on 17 August 2006 (NKGW01, NKGW02, NKGW04, and NKGW05) and analyzed for NDMA.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater analytical results are presented in Tables A-13-1 through A-13-4 and are discussed below.

5.1 Dissolved Oxygen

Dissolved oxygen results for the Third Quarter 2006, are presented in Table A-13-1.

During the Third Quarter 2006, the dissolved oxygen concentrations within Nike Missile Facility monitoring wells ranged from 0.31 to 3.51 mg/L in monitoring wells NKGW01 and NKGW02, respectively. These detections were within historical concentrations for dissolved oxygen.

5.2 NDMA

NDMA results for the Third Quarter 2006, are presented in Table A-13-1. During the Third Quarter 2006, NDMA was not detected above laboratory limits within any of the groundwater samples. This is the first sampling event where NDMA was not detected in groundwater

samples from NKGW01, NKGW04, and NKGW05. NDMA was detected above laboratory limits within three of the four Nike Missile Facility monitoring wells during the First Quarter 2006.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during the Third Quarter 2006 are consistent with historical values and interpretations.

NDMA was not detected within any of the Third Quarter 2006 groundwater samples. This is the first sampling event where NDMA was not detected above laboratory detection limits in groundwater samples from NKGW01, NKGW04, and NKGW05. NDMA was detected above laboratory limits within three of the four Nike Missile Facility monitoring wells during the First Quarter 2006.

A RAP is currently being prepared for the Nike Missile Facility and a revised groundwater monitoring plan will be implemented, in accordance with the RAP, when it is approved by the DTSC, RWQCB, and other stakeholders. There are no proposed changes to the groundwater monitoring program at this site.

Notes

1 - The identified analytical method is for samples performed beginning the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

NM - Not measured

NS - Not sampled

NDMA - N-nitrosodimethylamine

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter

NA - Not analyzed

ND - Not detected

VOCs - Volatile organic compounds

MTBE - Methyl tert-butyl ether

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

- 1 - All depth to water measurements are an average of three measurements recorded in the field.
- 2 - NKGW01 and NKGW05 were not located during the water level survey. Both wells were measured during sampling on 1 September 2005.
- 3 - Value represents the bottom of casing elevation in feet PLLW.
- 4 - Monitoring well was not located during the water level survey.
- 5 - NKGW01 was not located during the water level survey on 8 May 2001. The groundwater elevation was measured on 17 May 2001.

**BAKER BEACH DISTURBED AREA 3
APPENDIX SECTION A-14
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California**

1.0 INTRODUCTION AND BACKGROUND

Baker Beach Disturbed Area 3 (BBDA 3) is located along the western edge of the Presidio within the ravine south of Battery Crosby. The site is bordered on the west by the Pacific Ocean and on the east by Lincoln Boulevard. Battery Crosby is north of the site, and the access road for the battery off Lincoln Boulevard bisects the site (Figure 1). The site elevation ranges from approximately 50 to 250 feet above PLLW.

Based on a review of aerial photographs, BBDA 3 received fill material intermittently between 1948 and 1973. Fill material was initially placed in BBDA 3 for erosion control along Lincoln Boulevard and along the access road to Battery Crosby (Figure A-14-1). This area was used for additional dumping of debris until approximately 1973 (Treadwell & Rollo, 2004a).

On 6 February 2004, two temporary piezometers were installed and developed using surge and purge methods in general accordance with the FSP (Treadwell & Rollo, 2001a). At the time of the installation, the piezometers were identified as BB3PZ1A and BB3PZ1B. Subsequently, the piezometers were designated as BB3PZ100A and BB3PZ100B to adhere to QAPP naming conventions.

On 22 June 2004, both BBDA 3 temporary piezometers were abandoned following the Second Quarter 2004 sampling and prior to commencement of remedial construction activities described below in Section 3.0. BBDA 3 excavation activities were conducted between July and December 2004. Following the excavation activities, two monitoring wells, one piezometer and three fixed surface water sampling points were installed and quarterly groundwater monitoring began. An additional fixed surface water monitoring point, BB3SW104, and piezometer, BB3PZ102, were installed in the First Quarter 2006 as requested by DTSC.

2.0 SITE DESCRIPTION AND GEOLOGY

BBDA 3 is located near the southern boundary of the Coastal Groundwater Basin (Figure 1). Based upon hydrogeologic information from adjacent areas, groundwater may be present in limited areas of the landslide deposits, dune sands, and the weathered serpentinite bedrock formations. Groundwater has been encountered within the BBDA 3 footprint in the eastern portion of the site at depths of 18 to 29 feet bgs (Treadwell & Rollo, 2003b). Groundwater flow

follows the general topographic trend to the west toward the Pacific Ocean (Figures A-14-1 and A-14-2).

Battery Crosby is north of the site, and, prior to remedial activities, the access road for the battery off Lincoln Boulevard bisected the site (Figure A-14-1) (Treadwell & Rollo, 2005a). The fill material in BBDA 3 was composed primarily of soil and debris fill containing concrete, asphalt, and metal debris. Buttress fill material, consisting mainly of sand (fill sand) was initially placed in BBDA 3 along Lincoln Boulevard and along the access road to Battery Crosby. This area was used for additional dumping of debris (waste fill) until approximately 1973 (Dames & Moore, 1997).

The area in the vicinity of BBDA 3 is a steeply sloping bluff with a narrow beach (Baker Beach) at its base. Surface drainage in the area is to the west, toward the Pacific Ocean. Vegetation in the area consists of grasses, shrubs, and trees.

BBDA 3 lies at the boundary of two geologic regimes. The northern portion is predominantly Franciscan Formation overlain by landslide deposits, which generally consist of unstratified mixtures of bedrock fragments, sand, silt, and clay. The southern portion is covered almost entirely by Quaternary dune sand (Schlocker, 1974).

At the request of DTSC, the Trust performed a slope stability analysis at BBDA 3 to determine whether excavation of the waste fill material at the site might undermine the structural fill buttress supporting Lincoln Boulevard east of Battery Crosby Road. The findings of this investigation are documented in the *Slope Stability Evaluation Report, Baker Beach Disturbed Area 3* (Treadwell & Rollo, 2004d). As recommended in that report, the stability of the slope supporting Lincoln Boulevard was monitored during excavation of waste materials at BBDA 3.

A pair of temporary piezometers were installed and monitored as part of the slope stability evaluation. Groundwater was found to be present in the dune sands and weathered serpentinite bedrock formations (Treadwell & Rollo, 2004d). Surface water drainage and groundwater flow appears to follow the general topographic trend, to the west and toward the Pacific Ocean. As documented in the RAP, it was anticipated that removal of the fill material could alter the location(s) of the freshwater seep(s) located at the western boundary of BBDA 3.

3.0 REMEDIAL ACTION PLAN

The *Remedial Action Plan (RAP) for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4* selected excavation, recycling, and offsite disposal of impacted fill material and underlying soil, along with groundwater monitoring, as the remedial alternative for BBDA 3. The goal of the remediation at BBDA 3 was to remove all contaminated material, leaving in place soil that meets the established cleanup levels (Treadwell & Rollo, 2003b).

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes and residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to comply with the water quality protection standards or the cleanup levels presented in Section 3 of the RAP for three years. Tables A-14-1 through A-14-3 include groundwater cleanup levels applicable to BBDA 3 (Treadwell & Rollo, 2005a). These cleanup levels are based on the most stringent values for protecting drinking and freshwater seeps. RAP-specified groundwater cleanup levels for some analytes are slightly lower than their QAPP analytical reporting limits.

Prior to remediation excavation activities, existing temporary piezometers BB3PZ100A and BB3PZ100B were abandoned. Following completion of excavation activities, two new groundwater monitoring wells (BB3GW100 and BB3GW101) and four seep monitoring locations: one new piezometer (BB3PZ101) and three new fixed water monitoring points (BB3SW100 through BB3SW102) were installed to monitor groundwater quality in the area of BBDA 3. The new well, piezometer and fixed water monitoring point sampling locations are located near or within the former impacted area of BBDA 3 as shown on Figure A-14-1.

The monitoring well, piezometer and fixed water monitoring point sampling locations were installed in December 2004 after the completion of all excavation activities, but prior to the start of revegetation activities. Treadwell & Rollo supervised the drilling of the soil borings performed by Gregg Drilling and Testing, Inc. (Gregg Drilling) of Martinez, California. A track-driven, limited access drill rig equipped with 8-inch-diameter hollow-stem augers was used for drilling at the site. Soil borings were advanced below the water table to total depths of 37 feet bgs and 32 feet bgs for installation of wells BB3GW100 and BB3GW101, respectively. On 13 December 2004, piezometer BB3PZ101 was installed in a hand-auger boring to a total depth of 18 feet. Three fixed water monitoring point installations were also installed at former BBDA 3 on 8 December 2004. Treadwell & Rollo performed the hand-augering and installation of the fixed water monitoring points. The boring and well completion logs are included in the *Draft Construction Completion Report Baker Beach Disturbed Areas 3 and 4, Appendix I* (Treadwell & Rollo, 2005a).

At the request of the DTSC, a fixed water monitoring point (BB3PZ102) was installed and added to the monitoring program in March 2006, approximately 30 feet southeast of BB3SW100. BB3PZ102 was also installed at former BBDA 3 on 8 December 2004. The fixed water monitoring point was installed in a hand-auger boring to a total depth of 6.5 feet. Treadwell & Rollo performed the hand-augering and installation of the fixed water monitoring point on 11 March 2006. An additional seep location (BB3SW104) was identified and added to the program in February 2006.

4.0 GROUNDWATER MONITORING

Baker Beach Disturbed Area 3 has two monitoring wells (BB3GW100 and BB3GW101), two piezometers (BB3PZ101 and BB3PZ102), three fixed monitoring points (BB3SW100 through BB3SW102), and one surface water sampling location (BB3SW104) (Figure A-14-1).

Groundwater elevation measurements were attempted at all five locations during the Third and Fourth Quarters 2006. However, not all sampling locations contained enough water to measure.

Piezometer BB3PZ101, fixed water monitoring point BB3SW102, and surface water location BB3SW104 were either dry or were not flowing during both the Third and Fourth Quarters 2006. The groundwater elevation at piezometer BB3PZ102 was only measured during the Third Quarter 2006 and not measured in the Fourth Quarter 2006 because the piezometer was dry.

Groundwater samples were scheduled to be collected from all BBDA 3 monitoring wells, piezometers, and fixed water monitoring points during the Third and Fourth Quarters 2006. However, due to an insufficient amount of water, samples were only collected from monitoring well BB3GW100 during the Third and Fourth Quarters 2006. The proposed sampling schedules for the Third and Fourth Quarters 2006 are presented in Tables 1A and 1B, respectively.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements during the Third and Fourth Quarters 2006 were collected on 14 August and 4 December 2006 and are summarized on Table A-14-4. A groundwater elevation map showing groundwater contours and flow direction for BBDA 3 during the Third Quarter 2006 is included as Figure A-14-1. The groundwater surface was not contoured during the Fourth Quarter 2006 because a sufficient amount of groundwater data was not available (A-14-2). Data associated with the fixed monitoring points are not used in contouring. Water level meters were calibrated on 14 August and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the Third Quarter 2006, groundwater elevations at BBDA 3 ranged from 62.49 to 163.90 feet above PLLW in fixed water monitoring point BB3SW100 and monitoring well BB3GW100, respectively. To gain a broader understanding of groundwater gradients and flow directions in the BBDA 3 area, the groundwater elevations were evaluated with measurements from Fill Site 5. Groundwater flow direction was observed to be in a west-southwest direction toward the Pacific Ocean following the general topographic trend. The groundwater gradient was estimated to be approximately 0.22 feet per foot. The Third Quarter 2006 groundwater contours and flow direction for BBDA 3 is included as Figure A-14-1. Groundwater gradients and flow directions are consistent with previous findings at the site.

During the Fourth Quarter 2006 groundwater elevations at BBDA 3 ranged from 63.24 to 163.20 feet above PLLW in fixed water monitoring point BB3SW100 and monitoring well BB3GW100, respectively.

Since groundwater elevation measurements were not collected from Fill Site 5 during the Fourth Quarter 2006 and both BBDA piezometers were dry, the groundwater gradient and flow direction were not calculated.

4.2 Monitoring Well Purging and Sampling

Groundwater samples were scheduled to be collected from all BBDA 3 monitoring wells, piezometers, and fixed water monitoring points during the Third and Fourth Quarters 2006. However, due to an insufficient amount of water, samples were only collected from monitoring well BB3GW100 during the Third and Fourth Quarters 2006. During the Third and Fourth Quarters 2006, groundwater sampling at BB3GW100 was performed on 15 August and 6 December 2006, respectively. Monitoring well BB3GW100 samples were collected in accordance with methods shown in Tables 1A and 1B, and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, volumes, and general chemistry parameters, for BB3GW100 are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon polyethylene AST located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the Third and Fourth Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from monitoring well boring BB3GW100, during the Third and Fourth Quarters 2006, were analyzed for general chemistry parameters, TDS, and 22 dissolved metals. In addition to these analyses, TPHg, TPHd, and TPHfo were also analyzed within the sample collected from BB3GW100 during the Third Quarter 2006. All analyses were conducted in accordance with the groundwater sampling schedule (Tables 1A and 1B).

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the Presidio QAPP, with a carbon range of C₂₄ to C₃₆. Section 5.4.3.1 in the main report discusses the data compatibility issues associated with TPH analyses.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-14-1. During the Third and Fourth Quarters 2006, dissolved oxygen was measured in BB3GW100 at concentrations of 0.65 and 0.2 mg/L, respectively. Dissolved oxygen concentrations were within the historical range for monitoring well BB3GW100 during the Third and Fourth Quarters 2006.

5.2 General Chemistry Results

General chemistry results are presented in Table A-14-1. General chemistry results for the Third and Fourth Quarters 2006 within BBDA 3 monitoring well BB3GW100 were generally within historical ranges.

Nitrate was detected at a new low concentration of 4.9 mg/L within BB3GW100 during the Third Quarter 2006. Sulfate was detected at a new high concentration of 66 mg/L within BB3GW100 during the Third Quarter 2006. These new low and high concentrations were only slightly outside of the historical lows and highs and can be attributed to natural fluctuation. The remaining general chemistry results were within historical ranges during the Third and Fourth Quarters 2006.

5.3 TPH Results

The analytical results for TPHg, TPHd, and TPHfo, along with the RAP-specified cleanup levels, are presented in Table A-14-2. TPH was not detected above laboratory limits during the Third Quarters 2006 at BB3GW100.

5.4 Dissolved and Total Metals Results

Dissolved and total metals results for Third and Fourth Quarters 2006, along with RAP-specified cleanup levels, are presented in Table A-14-3.

Dissolved metal concentrations within BBDA 3 monitoring well BB3GW100 during the Third and Fourth Quarters 2006 are generally within historical ranges.

Nickel was detected at a new high concentration of 25 µg/L within both the primary and duplicate sample from BB3GW100 during the Third Quarter 2006. The new concentration is only slightly higher than the previous high concentration within this well of 22 µg/L and can be attributed to natural fluctuations. In addition, the new high concentration does not exceed the RAP-specified cleanup level of 100 µg/L for nickel.

During the Third Quarter 2006, manganese was detected in monitoring well BB3GW100 at a concentration of 24 µg/L within the primary sample and not detected above the laboratory's reporting limit of 10 µg/L in the primary duplicate sample. The RPD between these two samples

exceeds the QAPP-specified 50% criteria. However, the effect on the quality of the data was not known and therefore the data was not qualified for field duplicate failure by DataVal, as described in the Third Quarter 2006 DataVal report (Appendix D).

Future total and dissolved metals results will be collected at BBDA 3 in accordance with the RAP and trends will be identified as they become apparent.

6.0 Conclusions and Recommendations

The Third and Fourth Quarters 2006 were the eighth and ninth monitoring events, respectively, conducted at BBDA 3 since the groundwater monitoring network was installed. Future detections and concentration trends will continue to be monitored and evaluated in accordance with the RAP.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

2 - Piezometer was abandoned prior to the remedial action following Second Quarter 2004 in preparation for the remedial action.

3 - BB3PZ101 was formerly named BB3SW103.

4 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2003c).

mg/L - milligrams per liter

NA - not analyzed

NM - not measured

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

2 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2003c).

3 - BB3PZ101 was formerly named BB3SW103.

Bold numbers indicate concentrations of metals which exceed cleanup criteria.

All metals results represent dissolved metals, unless indicated as "total" in the left-hand column for total metal results. The target effective cleanup levels are presented for dissolved and total metals concentrations, as applicable.

mg/L - milligrams per liter

µg/L - micrograms per liter

NA - not analyzed

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - All depth to water measurements are an average of three measurements recorded in the field.

2 - Value indicates bottom of casing elevation in PLLW.

3 - BB3PZ101 was formerly named BB3SW103. Additionally, the depth to water measurement (14.45 feet) during the Fourth Quarter 2004 was measured from the ground surface. Subsequently, the ground and the top of casing elevations were surveyed and the depth to water measurement was converted to a top of casing measurement (16.80 feet).

FMP - Fixed Water Monitoring Point

NM - Not measured

MW - Monitoring Well

PZ - Piezometer

LANDFILL 10
APPENDIX SECTION A-15
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill 10 is located in the southwestern portion of the Presidio within the former U.S. Public Health Services Hospital (PHSH) area (Figure 1). The site elevation is between approximately 110 and 190 feet above the PLLW datum (Figure A-15-1).

In 1874, the War Department established the area as a full-service U.S. Merchant Marine Hospital (USACE, 1990; ANL, 1989). Hospital operations were transferred in 1927 to the former PHSH. In the 1930s, the hospital was demolished and replaced by the existing site structure. Demolition debris from the first hospital is believed to have been placed in Landfill 10. The hospital was closed in 1981.

Since September 1994, monitoring wells at Landfill 10 have been analyzed for BTEX, TPH, dissolved metals, TDS and/or general chemistry parameters. A summary of analytical results are presented in Tables A-15-1 through A-15-3.

Beginning in the Fourth Quarter 2003, sampling frequency was reduced from quarterly to annual at Landfill 10 monitoring wells LF10GW01, LF10GW02, and LF10GW03. Beginning in the Third Quarter 2005, sampling frequency was reduced from quarterly to annual at the remaining Landfill 10 monitoring well (LF10GW100) and at the Landfill 10 seep (LF10SP01).

The *Five Year Review and Field Investigation Report for Landfills 8 and 10* (FYR) was submitted to the regulatory agencies and RAB in January 2004 (URS, 2004). A Feasibility Study (FS) for Landfills 8 and 10 has been prepared (EKI, 2005). Additionally, the Trust is currently writing a RAP and designing new remedial actions for the two landfill sites. The RAP is scheduled to be completed in 2008.

2.0 SITE DESCRIPTION AND GEOLOGY

Landfill 10 is located in the Lobos Creek Groundwater Area of the Lobos Creek Groundwater Basin (Figure 1). The depth to groundwater ranges from approximately 5 to 43 feet bgs and groundwater flow follows the general topographic trend toward the southwest (Montgomery Watson, 1996b).

The approximately two-acre site consists of a former helipad and parking lot (Stollar, 1993). The site is underlain by landfill debris consisting mainly of sand with construction debris and varying amounts of rock, clay, and silt. The landfill debris is underlain by dune sand. Beneath the sand is the Colma Formation, which in turn, overlies the Franciscan Formation bedrock (Montgomery Watson, 1996b).

3.0 PUBLIC HEALTH SERVICE HOSPITAL RECORD OF DECISION

In early 1995, the U.S. Army completed the Record of Decision (ROD) for the Former PHS Area (PHS ROD). The PHS ROD addressed three remediation sites within the PHS Area, including Landfill 10. The PHS ROD proposed both soil and groundwater sampling at Landfill 10 to confirm that the fill material does not pose any threat to human health and the environment. In addition, the PHS ROD required the installation of two monitoring wells downgradient of the fill material (LF10GW01 and LF10GW02) and one monitoring well upgradient of Lobos Creek (LF10GW03). These monitoring well locations are presented on Figure A-15-1. Following the installation of the wells, the PHS ROD required quarterly groundwater monitoring for a minimum of one year to confirm that chemicals are not leaching from the fill material to the groundwater (Montgomery Watson, 1996b).

4.0 GROUNDWATER MONITORING

Landfill 10 has four associated monitoring wells and one surface water seep (Figure A-15-1). During the Third Quarter 2006, groundwater elevations were measured at three of the four Landfill 10 wells only. Monitoring well LF10GW02 and seep LF10SP01 were not measured due to inaccessibility and overgrown brush.

During the Fourth Quarter 2006, the overgrown brush had been cleared from around monitoring well LF10GW02 and groundwater elevations were measured at all four Landfill 10 wells. Additionally, the surface water seep, LF10SP01, was observed to be flowing during the Fourth Quarter 2006. Water level meters were calibrated on 14 August and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 14 August and 4 December 2006 at Landfill 10 monitoring wells. During the Third Quarter 2006, all locations, except LF10GW02 and LF10SP01, were measured. Well LF10GW02 and seep LF10SP02 were inaccessible during the Third Quarter 2006 due to overgrown vegetation. During the Fourth Quarter 2006, groundwater elevations were measured at all four Landfill 10 wells and the seep.

During the Third Quarter 2006, groundwater elevations ranged from 108.44 to 140.45 feet above PLLW in LF10GW01 and LF10GW03, respectively (Figure A-15-1). During the Fourth Quarter 2006, groundwater elevations ranged from 101.47 to 138.80 feet above PLLW in LF10GW02 and LF10GW03, respectively (Figure A-15-2).

In addition to the groundwater monitoring wells, the approximate location of LF10SP01 is posted on Figures A-15-1 and A-15-2. The groundwater elevations during the Third and Fourth Quarters 2006 are consistent with historical elevations measured at Landfill 10. Groundwater elevations are summarized in Table A-15-4.

Groundwater was determined to flow to the southwest following the general topographic trend during both quarters. The groundwater gradient was calculated to be approximately 0.09 feet per foot during the Third Quarter and 0.12 feet per foot during the Fourth Quarter 2006. Groundwater elevation maps showing groundwater contours and flow directions for Landfill 10 are included as Figures A-15-1 and A-15-2. Groundwater elevations, gradients, and flow directions are consistent with previous findings.

4.2 Monitoring Well Purging and Sampling

During the Third Quarter 2006, three of the four Landfill 10 monitoring wells were sampled on 14 August 2006. Monitoring well LF10GW02 and seep LF10SP01 were not sampled as they were inaccessible. During the Fourth Quarter 2006, all four monitoring wells and seep LF10SP01 were sampled on 6 December 2006.

Purge equipment, purging volumes, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon aboveground polyethylene storage tank located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used at each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the Third and Fourth Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from Landfill 10 monitoring wells during the Third and Fourth Quarters 2006 were analyzed for TPH. Groundwater samples collected from Landfill 10 monitoring well LF10GW02 and seep LF10SP01 during the Fourth Quarter 2006, were also analyzed for general chemistry, BTEX, TDS, and 23 dissolved metals. Seep LF10SP01 was also analyzed for total metals.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-15-1.

Dissolved oxygen was mistakenly not measured by the field team during the Third Quarter 2006. During the Fourth Quarter 2006, dissolved oxygen was only measured in monitoring well LF10GW02 at a concentration of 0.5 mg/L. The dissolved oxygen concentration measured during the Fourth Quarter 2006 was within the range of concentrations previously measured within monitoring well LF10GW02.

Dissolved oxygen was not measured in the majority of the wells at Landfill 10 during the Third and Fourth Quarters 2006 because it was not proposed on Tables 1A and 1B. This error has been corrected and dissolved oxygen measurements will resume at Landfill 10 during the First Quarter 2007.

5.2 General Chemistry

General chemistry parameters were not measured during the Third Quarter 2006. General chemistry parameters were measured in LF10GW02 and LF10SP01 during the Fourth Quarter 2006 and were within historical ranges, with the exception of total alkalinity and bicarbonate in LF10SP01 which were detected at concentrations slightly higher than historical results (Table A-15-1).

5.3 TPH Results

TPH results are presented in Table A-15-2. TPH was not detected in any monitoring well samples collected during either the Third or Fourth Quarters 2006.

During the Fourth Quarter 2006, TPHd and TPHfo were detected in seep LF10SP01 at concentrations of 2,700 µg/L and 1,100 µg/L, respectively. The concentration of TPHd was almost 20 times higher than the previous recorded high concentration and was the first detection of TPHd at this location since the Second Quarter 2003. TPHfo was detected for the first time at this location. These detected concentrations exceed the applicable cleanup level for TPHd and TPHfo in surface water of 50 µg/L (EKI, 2002).

TPH will continue to be monitored within Landfill 10 monitoring wells and seep LF10SP01 during future sampling events to see if apparent trends develop or if the Fourth Quarter 2006 results at LF10SP01 are an anomaly.

5.4 BTEX and MTBE Results

BTEX and MTBE results are presented in Table A-15-2. No samples were analyzed for BTEX and MTBE during the Third Quarter 2006.

During the Fourth Quarter 2006, BTEX and MTBE were analyzed in the groundwater sample collected from LF10GW02 and the surface water sample from LF10SP01. BTEX were not detected in any samples during the Fourth Quarter 2006. MTBE was detected at a new high concentration of 18 µg/L in LF10GW02. MTBE was not detected in the seep sample. The Presidio-wide cleanup level for MTBE in groundwater is 13 µg/L (EKI, 2002).

5.5 Dissolved and Total Metals Results

Total and dissolved metals results are presented in Table A-15-3. No samples were analyzed for dissolved or total metals during the Third Quarter 2006. Dissolved metals were only analyzed in samples collected from LF10GW02 and LF10SP01 during the Fourth Quarter 2006. Total metals were only analyzed within LF10SP01 during the Fourth Quarter 2006.

Dissolved metals concentrations during the Fourth Quarter 2006 were within historical bounds at LF10GW02. Dissolved metals at LF10SP01 were generally within historical bounds or slightly outside of the range of previously reported concentrations and are therefore, not considered to be significant.

During the Fourth Quarter 2006, total metals were analyzed in the groundwater sample collected from LF10SP01. Iron and potassium were detected at new high concentrations of 2,200 µg/L and 4,300 µg/L, respectively. Vanadium was detected for the first time during Fourth Quarter 2006 at a concentration of 13 µg/L. The remainder of the total metals concentrations detected in LF10SP01 during the Fourth Quarter 2006 are within historical ranges and do not appear to be significant.

Dissolved metal and total metal concentrations will continue to be measured at LF10SP01 to see if trends develop.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during Third and Fourth Quarters 2006 are consistent with historical values and interpretations.

During the Fourth Quarter 2006, TPHd and TPHfo were detected in seep LF10SP01 at new high concentrations of 2,700 µg/L and 1,100 µg/L, respectively. The concentration of TPHd was almost 20 times higher than the previous recorded high concentration and was the first detection of TPHd at this location since the Second Quarter 2003. TPHfo was detected for the first time at this location. TPH will continue to be monitored within Landfill 10 monitoring wells and seep LF10SP01 during future sampling events to see if apparent trends develop or if the Fourth Quarter 2006 results at LF10SP01 are an anomaly.

MTBE was detected at a new high concentration of 18 µg/L within monitoring well LF10GW02 during the Fourth Quarter 2006. MTBE will continue to be measured at LF10GW02.

Total vanadium was detected for the first time during Fourth Quarter 2006 at a concentration of 13µg/L. Dissolved metal and total metal concentrations will continue to be measured at LF10SP01 to see if apparent trends develop.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

mg/L - milligrams per liter

NA - Not analyzed

NM - Not measured

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain-of-custody.

µg/L - micrograms per liter

NA - Not analyzed

Y - Sample exhibits a fuel pattern that does not resemble the standard.

Z - Sample exhibits unknown single peak or peaks.

MTBE - Methyl tertiary butyl ether

BTEX - benzene, toluene, ethylbenzene, and xylenes

TPH - Total petroleum hydrocarbons

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes
All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly report.
2 - Beginning with the Second Quarter 2003, the Trust requested that all surface water seep samples be analyzed for total metals instead of dissolved metals. During Second Quarter 2003, the project laboratory filtered the metals sample for LF10SP01 and, therefore, the results are dissolved metals. Beginning with the Second Quarter 2004, the Trust requested that all surface water seep samples be analyzed for dissolved and total metals. Samples analyzed for total metals are not filtered in the field.
Groundwater samples collected from monitoring wells LF10GW01 through LF10GW100 were field filtered and analyzed for dissolved metals, except for samples collected from LF10GW100 during December 2002 and February 2003, which were analyzed for total metals.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed

Notes

1 - All depth to water measurements are an average of three measurements recorded in the field.

2 - The lid of monitoring well LF10GW100 has been surveyed by the Trust (175.60 feet PLLW). The elevation difference between the monitoring well lid and the top of casing was measured in the field and has been verified to be 0.30 feet. Therefore, the LF10GW100 top of casing elevation is approximately 175.30 feet PLLW.

3 - Approximate elevation.

MW- Monitoring well

NM - Not measured, location was not accessible

feet PLLW - feet above Presidio Lower Low Water vertical datum

**COMMISSARY/POST EXCHANGE AREA
APPENDIX SECTION A-16
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California**

1.0 INTRODUCTION AND BACKGROUND

The Commissary/Post Exchange (PX) Area is located in the north-central portion of the Presidio (Figure 1), in the area surrounding the Commissary (Building 610) and the PX (Building 605). Site elevations range from approximately 9 to 15 feet above the PLLW datum and the ground surface slopes gently to the north-northwest, towards San Francisco Bay.

Prior to the construction of the Commissary and Crissy Field Tidal Marsh, the area was part of the Motor Pool used by the Army for vehicle fueling and maintenance and included aboveground gasoline storage tanks (ASTs), underground fuel and waste oil storage tanks (USTs), a pump shed and an auto shop. The area was also used for the loading and unloading of railroad tank cars and was crossed by now abandoned underground fuel distribution pipelines.

Three wells (610GW101 through 610GW103) were installed at the site in 2001 as part of an interim removal action. These wells have been sampled quarterly since August 2001. Samples from these wells were analyzed for TPH, BTEX and general water chemistry. Additional monitoring wells were installed as part of Site Investigation (SI) activities in 2002 and 2003. Metals and TDS analyses, sampling of the additional wells, and two surface water seep sampling locations (610SP01 and 610SP02) were added to the groundwater monitoring program beginning in the Third Quarter 2002.

To evaluate changing redox conditions, pH, temperature and oxygen-reduction potential (ORP) were added to the program in the First Quarter 2006. The *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006a), concluded that ORP is a good indicator for evaluating changing redox conditions. The pH, temperature and ORP data are presented in Table A-16-1 and will be used in the ongoing redox evaluations at CAP sites.

Summaries of analytical results are presented in Tables A-16-1 through A-16-7.

2.0 SITE DESCRIPTION AND GEOLOGY

Based on historical groundwater level measurements, groundwater beneath the Commissary/PX Area does not appear to be tidally influenced and is typically present from approximately 3 to 6 feet bgs (Treadwell & Rollo, 2003a). Groundwater beneath the site generally flows northward towards the San Francisco Bay.

The Commissary and Crissy Field Tidal Marsh are located in an area of former tidal marshland. This marshland was filled in 1915 with hydraulically placed sand obtained from offshore sources (referred to as “the 1915 sand”). More recently, additional fill material was placed on top of the 1915 sand. The 1915 sand is laterally continuous over Crissy Field and locally ranges between 3 to 6 feet thick. The 1915 sand is underlain by native, highly plastic clay (Bay Mud) (Treadwell & Rollo, 2003a).

3.0 COMMISSARY/PX CORRECTIVE ACTION PLAN

The Revised Final CAP (Treadwell & Rollo, 2006) was approved by the Trust, NPS and all stakeholders.

Phase I of the CAP is currently ongoing (Geomatrix, 2006). Once Phase I of the CAP is completed, groundwater monitoring will be conducted in accordance with the Revised Final CAP.

4.0 GROUNDWATER MONITORING

Prior to Third Quarter 2006, the Commissary/PX Area had twelve associated groundwater monitoring wells and two surface water seep locations (Figure A-16-1), however, monitoring well 600GW101 was approved for removal from the program reducing the number of associated wells to eleven. During the Third Quarter 2006, groundwater elevations were collected at all eleven site wells. Both seeps were observed to be flowing during the Third Quarter 2006.

Water level meters were calibrated on 14 August and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

No groundwater elevations were collected from the Commissary/PX Area during the Fourth Quarter 2006 due to CAP implementation.

4.1 Groundwater-Level Measurements and Interpretation

During the Third Quarter 2006, the Commissary/PX Area monitoring wells were gauged between 11:50 PM and 1:04 PM on 14 August 2006. Observed low tide on 14 August 2006 was at 4:42 AM with a magnitude of 0.79 feet above PLLW.

Although groundwater does not appear to be tidally influenced at the Commissary/PX Area, as a precaution, an attempt was made during the Third Quarter 2006 to gauge the Commissary/PX monitoring well water levels within a period of approximately one hour so that any potential tidal effects on groundwater elevation were minimal. Predicted and observed tidal times and magnitudes during the Third Quarter 2006 are presented in Table 2A and Figure 2A of the main text, respectively. Tidal predictions and observations are taken from the National Oceanic and Atmospheric Administration's (NOAA) Center for Operational Oceanographic Products and Services (CO-Ops) website. The Third Quarter 2006 Commissary/PX Area groundwater elevations are presented in Table A-16-8. A groundwater elevation map for the Commissary/PX Area during the Third Quarter 2006 is illustrated on Figure A-16-2.

During the Third Quarter 2006, groundwater elevations at the Commissary/PX Area ranged from 5.96 to 14.64 feet above PLLW in monitoring wells 600GW102 and 600GW105, respectively (Figure A-16-2). The groundwater elevation measured in 600GW108 was the lowest to date within this well. Surface water seeps 610SP01 and 610SP02 were flowing during the Third Quarter 2006.

Groundwater generally flowed north towards the Crissy Field Marsh and San Francisco Bay (Figure A-16-2) during the Third Quarter 2006. However, the new low groundwater elevation measured in 600GW108, changes the groundwater contours in the area of this well to depict more of a westerly flow direction than normally observed in this area. During the Third Quarter 2006, groundwater gradients in the Commissary/PX Area were estimated to be approximately 0.012 feet per foot in the western half and 0.016 feet per foot in the eastern half of the area.

Groundwater elevations, gradients, and flow directions are generally consistent with historical values and interpretations, with the exception of the new low elevation in 600GW108. No significant trends or observations were identified at the Commissary/PX Area during the Third Quarter 2006.

4.2 Monitoring Well Purging and Sampling

No Commissary/PX Area monitoring wells or seeps were scheduled to be sampled during Third or Fourth Quarters 2006, however, seep 610SP01 was sampled during the Third Quarter because a petroleum-like sheen was noted on the water in the area of that sample location.

All samples were collected using methods shown in Tables 1A and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this subsection. Purge water was stored, for future disposal, in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected from Commissary/PX Area seep 610SP01 were submitted to the project laboratory and analyzed for general chemistry, 14 dissolved metals, total metals, TDS, sulfide, TPHg, TPHd, and TPHfo. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records at the conclusion of this section.

5.0 GROUNDWATER ANALYTICAL RESULTS

During the Third Quarters 2006, groundwater samples collected from the Commissary/PX Area Seep 610SP01 were analyzed for general chemistry, 14 dissolved metals, total metals, TDS, sulfide, TPHg, TPHd, and TPHfo.

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the QAPP, with a carbon range of C₂₄ to C₃₆.

Groundwater analytical results are presented in Tables A-16-1 through A-16-7.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-16-1. Dissolved oxygen meters are calibrated prior to sampling each day, as described in Section 5.4.1.1 of the main text.

During the Third Quarter 2006, the concentration of dissolved oxygen measured within 610SP01 was 1.37 mg/L, this dissolved oxygen concentration was within the range of previously measured concentrations at this location.

5.2 General Chemistry Results

General chemistry results are presented in Table A-16-1. General chemistry results measured in 610SP01 during the Third Quarter 2006 were within the range of concentrations previously detected at this location.

5.3 TPH Results

The results of the TPH analyses are included in Table A-16-2. TPHg, THPd and TPHfo were not detected within the sample from 610SP01 during the Third Quarter 2006, which indicates that the “petroleum” sheen observed may have been biological.

5.4 BTEX and MTBE Results

The results of the BTEX and MTBE analyses are included in Table A-16-3. MTBE was detected at a new high concentration of 4.3 within the sample from 610SP01 during the Third Quarter 2006. MTBE has not been detected within 610SP01 since Third Quarter 2001.

BTEX were not detected within 610SP01 during the Third Quarter 2006.

5.5 Total and Dissolved Metals Results

Total and dissolved metals results are presented in Table A-16-5. Total results are identified as such in the leftmost column.

The majority of dissolved metal concentrations detected within seep 610SP01 were within historical ranges and were also below their applicable CAP-specified cleanup levels. Dissolved arsenic was detected at 7.7 µg/L, below the 10 µg/L cleanup level. Dissolved magnesium and manganese were the only metals detected outside of historical bounds. Both were detected at concentrations higher than previously reported, neither have a CAP-specified cleanup level.

The table below summarize new high and low total metal analytical results for the Third Quarter 2006 within Commissary/PX Area surface water seep 610SP01 sample when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed. Only the new high or the new low is shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low Third & Fourth Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Total							
610SP01	Aluminum	4 / 4	170 *	16,000	--	29,000	µg/L
	Calcium	4 / 4	52,000	230,000	--	270,000 *	µg/L
	Magnesium	4 / 4	40,000	360,000	--	460,000	µg/L
	Manganese	5 / 5	550	2,800	--	4,800	µg/L
	Sodium	4 / 4	140,000	3,500,000	--	3,800,000	µg/L

An asterisk (*) indicates qualified data in the above table.

CAP-specified cleanup levels do not apply to total metals concentrations.

Total metal results are generally significantly higher than their associated dissolved metals results because soil particles present in the samples likely contributed to the total metals concentrations. The total metals data collected to date at the Commissary/PX Area do not exhibit specific upward or downward concentration trends.

6.0 GROUNDWATER REDOX PARAMETERS

In addition to the above evaluation, a modified redox diagram was developed for seep 610SP01. The redox diagram was generated using the Sequence™ program and concentrations of dissolved oxygen, nitrate, manganese, iron, sulfate and methane and is plotted on Figure A-16-3. The redox diagram consists of multiple axes, with each individual axis representing one of the above analytes and is associated with the seep location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment.

7.0 CONCLUSIONS & RECOMMENDATIONS

No CAP-specified cleanup levels were exceeded during either the Third Quarter 2006. No other significant findings or data trends were observed during the Third Quarter 2006.

Groundwater monitoring will not be performed within Commissary/PX Area monitoring wells until the CAP is finalized and implemented at which point groundwater monitoring will be conducted in accordance with the Revised Final CAP.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - The QC laboratory reported results for Nitrogen as Nitrate and Nitrite combined.

3 - The QC laboratory reported results for Nitrogen as Nitrate and Nitrite combined. However, the combined Nitrogen as Nitrate and Nitrite result (< 0.5 mg/L) was rejected during data validation.

mg/L - milligrams per liter

NA - Not analyzed

NM - Not measured

"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006)

Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.

µg/L - micrograms per liter

TPH - Total petroleum hydrocarbons

NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006).

Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.

µg/L - micrograms per liter

MTBE - Methyl tertiary butyl ether

VOC - Volatile organic compound

NA - Not analyzed

ND - Not detected

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

-- - cleanup level not established

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006).

Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.

-- cleanup level not established

µg/L - micrograms per liter

PAHs - Polycyclic aromatic hydrocarbons

NA - Not analyzed

ND - Not detected

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly report.

2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006).

All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.

Concentrations in **BOLD** indicate dissolved metals concentrations which exceed applicable cleanup levels. CAP cleanup levels apply only to dissolved concentrations.

-- cleanup level not established

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

2 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration. As III has been detected at greater concentrations than inorganic As, due to analytical variability. As V is reported as non-detect when As III is detected at a greater concentration than inorganic As.

3 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006).

µg/L - micrograms per liter

mV - millivolts

NA - Not analyzed

All Third Quarter 2005 arsenic speciation results were qualified as estimated (J) by the laboratory because the samples were received at a temperature slightly higher than the required 4 degrees Celsius. Additionally, Third Quarter 2005 As III results from 610GW102 and 610SP02 were qualified with a J- by DataVal because the continuing calibration verification percent difference failed QC limits, which indicates the sample result is biased low. Several other Third Quarter 2005 results were qualified by DataVal with either a (U) or (J) in addition to the (J) qualifier applied by the laboratory. These qualifiers are defined in Table 11 of the main text.

Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Analytical results represent dissolved arsenic, unless indicated as "total" in the left-hand column, for total arsenic results.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

BAKER BEACH DISTURBED AREAS 1 AND 2A
APPENDIX SECTION A-17
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
THIRD AND FOURTH QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Baker Beach Disturbed Area (BBDA)s 1 and 2A are located along the western coastline of the Presidio, south of the Golden Gate Bridge. The site is bordered by the Golden Gate Bridge Highway and Transportation District to the north, Merchant Road, and Lincoln Boulevard to the east and the Pacific Ocean to the west. BBDAs 1 and 2A are situated immediately west of Batteries Boutelle and Marcus Miller, and north of BBDA 2 (Figure 1). The site elevation ranges from approximately 10 to 250 feet above PLLW.

BBDAs 1 and 2A have been identified as “disturbed areas” where buried waste fill is present (Figure A-17-1). Based on a review of aerial photographs, BBDAs 1 and 2A received fill material intermittently between 1946 and 1973 (MACTEC, 2004a). The fill material in BBDAs 1 and 2A is composed primarily of soil and debris fill containing concrete, asphalt, and metal debris (Figure A-17-1).

Freshwater seeps are present at various locations throughout the Coastal Bluffs (MACTEC, 2004a). On 21 and 22 April 2005, two piezometers were installed within the fill to monitor freshwater seeps at BBDA 1. The piezometers were designated as BB1PZ100 and BB1PZ101. An ephemeral seep, BB2ASW100, flows seasonally at the toe of the fill at BBDA 2A (A-17-1). Summaries of dissolved oxygen, general chemistry, TPH, and metals, PAH, and VOC results are presented in Table A-17-1 through A-17-4.

Remedial excavation is planned for these areas and is scheduled to begin in 2007. Monitoring and sampling of the freshwater seeps at BBDAs 1 and 2A will continue until commencement of remedial construction activities. The piezometers will be abandoned prior to the remedial action. Following remediation, a monitoring program at BBDAs 1 and 2A will be conducted in accordance with the Final RAP (in preparation).

2.0 SITE DESCRIPTION AND GEOLOGY

BBDAs 1 and 2A are located in the Coastal Groundwater Basin (Figure 1). Based upon hydrogeologic information from adjacent areas, groundwater may be present in limited areas of the landslide deposit and the weathered serpentinite bedrock formations. Groundwater flow is assumed to follow the general topographic trend westward toward the Pacific Ocean (Figure A-17-1).

The fill material at the sites is characterized as random mixtures of soil, chert, and serpentinite fragments, debris fill including building debris (red brick, concrete, glass, and wood) and glass, ceramics, and automotive parts (MACTEC, 2007).

The area in the vicinity of BBDA 1 and 2A is a steeply sloping bluff with a narrow beach at its base. Surface drainage in the area is to the west, toward the Pacific Ocean. Vegetation in the area consists of grasses, shrubs, and trees.

Local geology is predominantly Franciscan Formation overlain by landslide deposits. The Franciscan Formation in the area consists primarily of serpentinite and minor amounts of sandstones, shales, and cherts; the overlaying landslide deposits generally consist of unstratified mixtures of bedrock fragments, sand, silt, and clay (Schlocker, 1974). The thickness of debris fill is estimated to be greater than 3.5 feet in this area. (MACTEC, 2007).

Ephemeral seeps are monitored at two locations at BBDA 1 (BB1PZ100 and BB1PZ101) and at the toe of the fill at BBDA 2A (BB2ASW100) (Figure A-17-1). These seeps are likely the result of groundwater flow through bedrock fracture zones or along contacts between units of differing permeability, similar to other areas on coastal bluffs at the Presidio. The seeps may also be associated with surface water runoff in the fill overlying the bedrock surface.

Historical surface water monitoring data for BBDA 1 and 2A are presented in the *Redlined Recommended Revised Draft Remedial Action Plan, Baker Beach Disturbed Areas 1 and 2A, and Twenty-Six Other Sites* (RAP3) (MACTEC, 2007). As documented in the Revised Draft RAP3, it is anticipated that removal of the fill material could alter the location(s) of the freshwater seep(s) located at BBDA 1 and 2A.

3.0 REMEDIAL ACTION PLAN

The Revised Draft RAP3 is currently being reviewed by the Trust and the NPS and was submitted to the DTSC, RWQCB, and RAB for concurrence in March 2007. The public review draft of RAP3 is scheduled to be submitted by May 2007. Based on the soil analytical results from previous investigations, contaminants of concern (COCs) in soil identified for BBDA 1 and 2A include pesticides, PAHs, VOCs, TPH and metals. Additionally, PCBs and dioxins and furans are COCs at BBDA 1. Groundwater/seep water COCs include metals, mercury PAHs, and TPH at BBDA 1; and metals, pesticides, and PAHs at BBDA 2A.

Groundwater and freshwater seep monitoring at the BBDA 1 and 2A will be conducted in accordance with the RAP3 when the RAP3 is finalized. The current analytical suite for freshwater seep samples is to monitor for the groundwater COCs and most soil COCs. The recommended remedial actions for the BBDA 1 and 2A will be discussed in detail in this report when RAP3 is approved by the stakeholders. Cleanup levels proposed in the RAP3 are based on human health drinking water and freshwater seep quality criteria and are presented in

Tables A-17-2 through A-17-4. Prior to implementing excavation activities proposed in RAP3, existing piezometers BB1PZ100 and BB1PZ101 will be abandoned.

4.0 FRESHWATER SEEP MONITORING

BBDAs 1 and 2A were added to the Presidio-Wide Groundwater Monitoring Program beginning in the Second Quarter 2006. Prior to that event, Site monitoring and sampling was performed and reported as part of the RAP3 activities. The Third and Fourth Quarters 2006 were the third and fourth expanded monitoring events conducted at BBDAs 1 and 2A, since the piezometers were installed in April 2005 and BB1PZ101 was sampled for TPH, PAHs, VOCs, and metals. The BB2ASW100 seep location was dry during the Third and Fourth Quarters 2006 and therefore no water elevations or samples were collected. The proposed sampling schedules for Third and Fourth Quarters 2006 are presented in Tables 1A and 1B, respectively. During the Third and Fourth Quarters 2006, fresh water seep elevations were measured and sampling was performed within the two piezometers (BB1PZ100 and BB1PZ101).

4.1 Fresh Water Seep-Level Measurements and Interpretation

Fresh water seep elevation measurements were collected on 14 August and 4 December during the Third and Fourth Quarters 2006, respectively. The fresh water seep elevations for the Third and Fourth Quarters 2006 at BBDAs 1 and 2A are shown on Figures A-17-1 and A-17-2, respectively. Water level meters were calibrated on 14 August and 4 December 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

Fresh water seep elevations at the BBDA 1 during the Third Quarter 2006 were 63.61 and 103.68 feet above PLLW in piezometers BB1PZ101 and BB1PZ100, respectively (Table A-17-5).

Fresh water seep elevations at the BBDA 1 during the Fourth Quarter 2006 were 63.24 and 103.66 feet above PLLW in piezometers BB1PZ101 and BB1PZ100, respectively (Table A-17-5).

BBDA2A seep BB2ASW100 was not flowing during the Third or Fourth Quarters 2006.

Groundwater contours and flow directions for BBDAs 1 and 2A could not be calculated due to the lack of monitoring locations. However, the apparent surface water flow direction across BBDA 1 was observed to be in a westerly direction toward the Pacific Ocean following the general topographic trend.

4.2 Monitoring Well Purging and Sampling

Two piezometers (BB1PZ100 and BB1PZ101) and seep location BB2ASW100 were proposed for sampling during the Third (Table 1A) and Fourth Quarters 2006 (Table 1B) at BBDA 1 and 2A. The results from the Third and Fourth Quarters 2006 are included in Tables A-17-1 through A-17-5.

During the Third Quarter 2006, BBDA 1 piezometers BB1PZ100 and BB1PZ101 were purged and sampled on 14 August. During the Fourth Quarter 2006, BBDA 1 piezometers BB1PZ100 and BB1PZ101 were purged and sampled on 4 December. Seep location BB2ASW100 was not flowing during both the Third and Fourth Quarters 2006 and therefore, could not be sampled. All samples were collected in accordance with methods shown in Tables 1A and 1B and procedures described in the FSP (Treadwell & Rollo, 2001a).

Purging equipment, purging volumes, purge water parameters, and sampling equipment for each sampling location are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All fresh water seep samples were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the Third and Fourth Quarters 2006.

5.0 SURFACE WATER ANALYTICAL RESULTS

During the Third and Fourth Quarters 2006, BBDA 1 piezometers BB1PZ100 and BB1PZ101 were purged and sampled for dissolved oxygen, general chemistry parameters, OCPs, PAHs, TPHd, TPHfo, and both dissolved and total metals. All analyses were conducted in accordance with the groundwater sampling schedule (Tables 1A and 1B). Seep location BB2ASW100 was not flowing during both the Third and Fourth Quarters 2006 and therefore, could not be sampled.

A discussion of the detected analyte concentrations is provided below.

5.1 Dissolved Oxygen and General Chemistry Results

Dissolved oxygen and general chemistry results are presented in Table A-17-1.

During the Third Quarter 2006, dissolved oxygen was measured at concentrations of 0.49 and 2.0 mg/L within BB1PZ100 and BB1PZ101, respectively. During the Fourth Quarter 2006, dissolved oxygen was measured at concentrations of 0.6 and 0.8 mg/L within BB1PZ100 and BB1PZ101, respectively. The Third and Fourth Quarter 2006 dissolved oxygen concentrations are significantly lower than those measured during the Second Quarter 2006. A sufficient amount of dissolved oxygen data has not yet been collected from these locations to assess trends.

General chemistry analytical results are also presented in Table A-17-1. In general, total alkalinity, bicarbonate, chloride, fluoride, and sulfate are slightly higher in samples collected from BB1PZ101 than those collected from BB1PZ100. Trends will continue to be monitored during future sampling events.

5.2 TPH Results

The analytical results for TPHd and TPHfo are presented in Table A-17-2.

During the Third Quarter 2006, TPHd was detected at concentrations of 62 µg/L at BB1PZ101 and 180 µg/L at BB1PZ100; the Draft RAP3 cleanup level for TPHd is 115 µg/L. TPHfo was detected at a concentration of 910 µg/L in BB1PZ100 above the Draft RAP3 cleanup level of 144 µg/L and was not detected in BB1PZ101. During the Fourth Quarter 2006, TPHd and TPHfo were not detected above the laboratory limits in either BB1PZ100 or BB1PZ101. As shown in Table A-17-2, concentrations of TPHd and TPHfo at BBDA 1 have been generally decreasing since the piezometers were installed.

5.3 Total and Dissolved Metals Results

The total and dissolved metals and TDS results for Third and Fourth Quarters 2006, along with RAP-specified cleanup levels, are presented in Table A-17-3. Total cadmium exceeded the RAP-specific cleanup level in BB1PZ100 during the Third Quarter 2006 and total mercury exceeded the RAP-specified cleanup levels during the Third and/or Fourth Quarters 2006 in both BBDA 1 piezometers.

5.4 PAH Results

During the Third and Fourth Quarters 2006, BB1PZ100 and BB1PZ101 samples were analyzed for PAHs.

During the Third and Fourth Quarters 2006, only fluoranthene was detected within BB1PZ100 at concentrations of 0.07 and 0.04 µg/L, respectively. Neither of these concentrations exceed the RAP-specified cleanup level for fluoranthene of 300 µg/L at BBDA 1. No other PAHs were detected within the samples collected from BB1PZ100 and BB1PZ101 during the Third or Fourth Quarters 2006.

6.0 CONCLUSIONS AND RECOMMENDATIONS

BBDAs 1 and 2A were added to the Presidio-Wide Groundwater Monitoring Program beginning Second Quarter 2006. Two piezometers (BBDA1PZ100 and BB1PZ101) monitor fresh water seeps at BBDA 1 and one seep location is monitored at BBDA 2A (BB2ASW100).

Due to limited data collected to date, no significant trends were identified during the Third and Fourth Quarters 2006 at BBDAs 1 and 2A. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP, which is scheduled to be completed in 2007.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2006.

2 - Seep water target effective cleanup levels were taken from *Redlined Recommended Revised Draft Remedial Action Plan, Baker Beach Disturbed Areas 1 and 2A, and Twenty-Six Other Sites, Presidio of San Francisco, California* (MACTEC, 2007).

All metals results represent dissolved metals, unless indicated as "total" in the left-hand column for total metal results. The target effective cleanup levels are presented for dissolved and total metals concentrations, as applicable.

Bold numbers indicate concentrations of metals which exceed cleanup criteria.

mg/L - milligrams per liter

µg/L - micrograms per liter

NA - not analyzed

-- - not available or applicable

Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.
